After "lurking" on this list for awhile - it occurs to me that we need to agree on a standard for Latitude - Longitude notation.

1. N dd mm ss  
W dd mm ss
2. N dd.mmmm (etc)
3. N dd.mm.ss

Tha above w/o the N & W (which are assumed)

4. ddm. mm/ddmm. mm

So when I see a numeric string - how should I interpet it. I would assume the first two digits are degrees - the second two are minutes BUT are the 5th and 6th digits seconds? or min/100 (hundredth of minutes)????

Just thought that I'd throw it out for discussion.....

> Now if I only got a working TNC here :-)

Hmmm... does DOSEMU work with the recent kernels now? It's been awhile since I played with it.

I need more comports -- all 4 of them are taken (TNC, Ultimeter II, Modem 1, Modem 2) -- i'm mouseless. :-)

Keith,

You probably need to post the format you want for the messages.. give and example like:

-----

Name, Address, Phone Number, etc.

-----

That being the whole message! (what is between the lines.)

I know that I am unsure exactly what makes up a POSIT and don't want to flood you with unusable info. Being a new user of MacAPRS I don't know all the terms yet. Thanks for listening (reading? ;-)

More as it happens...

---

Hi Sam

Let me know what you get going. Just bought a Garmin GPS-45 to put in my pack. I like the idea of a "standard" GPS instead of an OEM board is that the standard unit has display, etc. and can be used standalone. Plus the standard GPS's are no more expensive. But an OEM board is a more compact and durable package.

So far we use GPS mostly for positioning helicopters so they are in the correct search area, in position to observe ground teams and to do pickups.

One of our problems with ground team communication is lack of VHF line of sight while teams are in canyons and valleys or base camp is behind a ridge. As a result we mostly use repeaters which cover the east Olympics. What we really need is a digipeater with the same kind of coverage. Even then, getting out is a problem. For example from the climber's camp for the Brothers, I had to jump from log to log over the stream to find a "hot spot".

73 and good luck

## 206. Countdown: STS-70 SAREX Mission (fwd)

From: Greg Jones <gjones@tenet.edu>  
Date: Thu, 13 Jul 1995 10:36:37 -0500 (CDT)  
To: aprssig@tapr.org (BBS SIG mailing)  
Message-ID: <199507131536.KAA27170@Leslie-Francis.tenet.edu>  
Rendered body type: text/plain

Has anyone thought of reposting the Keps from the STS-70 mission to APRS SIG for the experiemet ? From AMSAT-KEPS.

Cheers - Greg, WD5IVD

---

Countdown: STS-70 SAREX Mission

The next Space Shuttle mission carrying the Shuttle Amateur Radio EXperiment (SAREX) payload on-board is currently slated for launch this morning, Thursday July 13 at 1341 UTC. The STS-70 Space Shuttle Discovery mission will carry Amateur Radio operator Donald A. Thomas, KC5FVF, and recent licensee Nancy J. Curie, KC5OZX, into a 28.5 degree inclination orbit for an 8 day mission. The primary objective of this flight is to deploy the last spacecraft in the current series of the Tracking Data Relay Satellite System (TDRSS).

Ten schools from the US and Argentina have scheduled ham radio contacts with the astronauts. Several of these school group contacts will be performed using AMSAT's worldwide network of telebridge stations. The telebridge allows students to talk to the astronauts through a remote ground station that is linked to the school though a phone bridge. The Goddard Amateur Radio Club, WA3NAN expects to retransmit some of these school contacts as part of their shuttle retransmission activities. A limited number of schools who wish to "eavesdrop" on the STS-70 school group contacts via a listen only phone connection are encouraged to send email to Frank Bauer, KA3HDO, with your request. Your request should include an explanation of how you are going to use this listen only dialog in your classroom setting. Mr. Bauer's e-mail address is ka3hdo@amsat.org.

Thanks to Frank Bauer, KA3HDO, of the SAREX Working Group for the preceding information.

The following are prelaunch Keplerian elements for tracking the space shuttle.

Two line set JSC-001 is predicted from 13 July at 1423 UTC to 13 July at 2008 UTC.

STS-70  
1 99970U 95194.62046583 -.00253378 00000-0 -85192-3 0 18  
2 99970 28.4669 326.3673 0004615 286.6946 73.3195 15.91124517 24

Two line set JSC-002 is predicted from 13 July at 2008 UTC to 14 July at 1906 UTC (after the satellite separation burn).

STS-70

```
1 99970U      95194.87144219 -.00026652 00000-0 -11039-3 0   23
2 99970 28.4677 324.4866 0023185 193.1645 166.8399 15.85477873 64
```

Set JSC-003 is after the orbit adjust burn. Since the majority of the SAREX activity will be during this last part of the flight, the two line set and AMSAT format are included for JSC-003. JSC-003 is predicted from 14 Jul at 1906 UTC to 21 July 95 at 1051 UTC.

STS-70

```
1 99970U      95195.81551904 .00017899 00000-0 55675-4 0   38
2 99970 28.4680 317.4832 0016417 154.9557 205.1895 15.89705110 217
```

Satellite: STS-70

## 208. PS/2 Special Mouse Port

From: Bradley Lee Ambers <brad@ecst.csuchico.edu>  
Date: Thu, 13 Jul 1995 09:15:28 -0700 (PDT)  
To: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Cc: aprssig@tapr.org  
Message-ID: <Pine.HPP.3.91.950713090959.25318A-100000@napalm.ecst.csuchico.edu>  
Rendered body type: text/plain

Hello Bob, here is a little something to make your day. I know this has come up in the past and I thought I would ask if you have decided yet to incorporate it into one of your many version updates. For us who are using the IBM or Microsoft PS/2 mouse port and are mouseless on APRS are you considering the possibility of allowing us to use our mice in the near future? This is not a real big thing for someone who has been used to using the control keys and etc since version 5.8 or so.

Take care and have fun and thanks for the many hours of enjoyment you have given us all on APRS. 73's

Brad

## 209. Re: [APRSSIG:2220] Space mode is acting wierd!

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Thu, 13 Jul 1995 12:39:04 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950713122400.17966A@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

On Thu, 13 Jul 1995, Barbara Fehner wrote:

> I have been practicing for the up-coming Space Shuttle test:

> 1. The Space mode does not set the Grid-Square mode. I have to set  
> Grid-Square mode first and then set Space mode  
APR REPLY: OOPS, yes!

> 2. When a position packet is sent I get the "Congratulations" message  
> although my TNC is DISCONNECTED! Good for the ego but not for a QSL.  
APR REPLY: True, APRS is NOT trying to connect nor get a QSL... I don't  
think there is anyway to intersperse UI frames between connect REQ's.  
But if you are going to try to CONNECT, then go to O-C-T screen and be  
sure that MCOM is on and MCON is on so you can still monitor while  
connecting. Then use alt-X to exit back to APRS, NOT ESC. Since ESC will  
have APRS do the usual DISC first. Alt-X goes back to APRS but leaves  
TNC exactly as you left it in O-C-T. If you get a CONNECT, hopefully,  
APRS will return you to O-C-T mode automatically.

> 3. Space mode does not set "OTHER" mode although "Grid-Sq" mode does.  
> 4. When a beacon packet is sent the following message is displayed:  
> LINK STATE IS DISCONNECTED  
REPLY: APRS always sends a DISC command to the TNC whenever it sends a  
BEACON. This is to be sure that someone has NOT left you in CONNECT  
mode, which would take you off-line for APRS.

SUMMARY: Version 71 (not recommended for download) fixed problem 1 and 3.  
Ver 71a may be complete by Friday. I had not planned for APRS-SAREX to  
also permit simultaneous CONNECT-SAREX activity. I guess you make a  
choice...

On Thu, 13 Jul 1995, David W. Barrow III wrote:  
> After "lurking" on this list for awhile - it occurs to me that we need  
> to agree on a standard for Latitude - Longitude notation.

APR REPLY: I worked long and hard on coming up with the APRS standard to  
be as brief as possible. So for the purpose of this SIG, I hope everyone  
will use ddmm.hhN/ddmm.hhW exactly as is shown in all APRS posits.

Rendered body type: text/plain

KEITH wants all POSITS to go to him, but he neglected to suggest a format  
because he has not yet written the code. But his job will surely be easier  
if we all use the SAME format. Here Keith is MY input.

POS:W3ADO :3859.11N/07629.11W&Naval Academy

FORMAT: POS: this is an alert for Keith to SEARCH for  
Callsign padded to 9 spaces  
LAT/LONG in APRS format  
SYMBOL character & for gateway  
y for Beam antenna (DF resource)  
- home QTH  
. others.  
COMMENTS up to 35 characters

EVERYONE else send yours to KEITH, NOT THE SIG!  
His address ksproul@noc.rutgers.edu

---

## 212. Posits Request..

Rendered body type: text/plain

For those of you that have APRS or MacAPRS up and running, I would like your  
posit as it is sent from your computer over the air.. If you do NOT have  
this, then just send me your call sign and lat-lon in a simplistic form

The APRS format is:

callsign>APRS:!!ddmm.ssN/dddmm.ssWx

where dd or ddd is Degrees  
mm is Minutes  
ss is DECIMAL minutes  
x is STATION TYPE if you don't know, use '-'

Keith

Bob, Thank you for the info however I think you misunderstood my point. I said:  
  
>>2. When a position packet is sent I get the "Congratulations" message

>>although my transceiver is DISCONNECTED! Good for the ego but not  
>>so good for a QSL.

I meant that when I tell APRS to send a position packet to my TNC it shows me the "Congratulations" message even though my transceiver is physically disconnected from the TNC. ie. the packet is not being sent over the air hence it is not being digipeated!

73's,

Barbara KK6IB

The APRS upgrade file 7bto71a.zip is being posted on  
ftp@tapr.org//tapr/SIG/aprssig/upload right now.  
Other upgrades and full version will be done later...

71a has the ability to set the time to next pass, and select N passes after that. When the pass occurs, then all timers are reset and your station begins sending posits affresh... AND decaying them in the usual doubling fashion... then adds 92 minutes and begins again, N times. This was so you can set up for un-attended operation while you are at work.

Use the W key in INSTANTRACK to show you the time to next pass.

I guessed at 92 minutes. This mission may be closer to 90, so your choice of a start time will be a compromise across the usual 3 orbits you might see. See the new copy of SPACE.txt

I made this NEXT-PASS feature for registered users only, since this is a precursor for an APRtrak program that I am writing for AMSAT and because we want control over the number of stations on the uplink for now..

> hence it is not being digipeated!

APR REPLY: Then you have a cross connected path for your transmit audio to get somehow back into your receive audio such that your own TNC is seeing itself. This is NOT normal. Disconnect the radio audio cable at the TNC and see if it persists. IF so, maybe there is a TNC type that has this engineering flaw. What type is it?? WORK AROUND is to set Grid Square mode only. Only difference in SPACE mode IS the congrats message... (and in 71a, the ability to work the bird unattended. Un attended will NOT work with this problem, cuz as soon as you get the congrats message, then your timers are maxed out so that you are forced to STOP xmitting...

## 220. [APRSSIG:2229] RE: THANKS

From: jeff.brenton@espi.com  
Date: Fri, 14 Jul 95 00:56:03 -0500  
To: aprssig@tapr.org  
Message-ID: <9507140056.01B940A@espi.com>  
Rendered body type: text/plain

Phil Keys typed, "What we really need is a digipeater with the same kind of coverage."

With packet, all the helicopters can be digipeaters, or a tethered balloon can be sent aloft with a digipeater, etc. Digipeaters can be a lot smaller than full-duplex voice repeaters...

## 221. STANDARD Notation

From: jeff.brenton@espi.com  
Date: Fri, 14 Jul 95 00:56:08 -0500  
To: aprssig@tapr.org  
Message-ID: <9507140056.01BBM0A@espi.com>  
Rendered body type: text/plain

David W. Barrow III suggest a standard for notation - I think we should stick with the APRS notation, since it makes sense.

4218.76N/08825.54 is 42 degrees, 18.76 minutes North, 088 degrees, 25.54 minutes West. Works for me, since most LORAN and GPS receivers output in hudredths of a minute, rather than seconds...

## 222. Garmin 55AVD and APRS

From: jeff.brenton@espi.com  
Date: Fri, 14 Jul 95 00:56:10 -0500  
To: aprssig@tapr.org  
Message-ID: <9507140056.01BCU0A@espi.com>  
Rendered body type: text/plain

Bob, the Garmin 55AVD outputs the altitude as part of a proprietary sentence, the \$PGRMA sentence, to be exact. It does not output any sentence that includes the position in all three dimensions.

This sentence consists of:

\$PGRMA,nnnnn,F,\*nn

where the \*nn is the standard checksup, the F means "feet" (I presume, but did not test to see, that it outputs M for metres, and the nnnnn is the altitude.

When I fed APRS the stream I captured from a trip around the country block (about 10 miles), it rejected all the \$PGRMAs, as I kind of expected. Any chance of a future version parsing this sentence, so my aeronautical mobile trips will actually LOOK /AM?

Subject: [APRSSIG:2226] Standard Notation for L/L

Re the suggested formats for "standard" Lat/Long. Please do NOT assume that the posits are N and W!!! mine are N and E and, as I live a few km from the equator, a buddy of mine is S and E. By-the-way Bob, I created a track file from a 100km trip round here and attempted to load it into Mapfix6.8 to create a map. Nothing there. I finally found the track somewhere north of the Galapagos Islands!! - In mirror image form. The program assumed that the Long was east. After changing a line of code it now works fine (I don't think that this was your program though - someone else supplied it to you).

Also thanks to those who helped me figuring out how to download the Garmin45.

## 224. APRS at the Atlanta Hamfest this weekend

From: rwf@mindspring.com (rwf)  
Date: Fri, 14 Jul 1995 07:32:09 -0400  
To: aprssig@tapr.org  
Message-ID: <199507141132.HAA27517@dylan.mindspring.com>  
Rendered body type: text/plain

We have a very active and interested APRS Group down here in Atlanta. Well... maybe not a Group, in the sense of organization, but at least a lot of users. This, of course, leads to a lot of conversation about APRS on the local voice repeaters, and a lot of questions regarding our upcoming GPS/ATV/APRS weather balloon flight scheduled for July 29th.

Since a Hamfest is happening this weekend, we thought this would be a good time to officially introduce local Hams here to APRS. I'm a very active ATVer and our ATV demos and info sessions have been very popular here. I spoke with Gwyn at Paccomm about the possibility of some similar type of APRS demo, possibly jointly done.

The way it ended up is that Gwyn is allowing several of us to perform the APRS demo that he normally does. We will set up right in his Vendor booth and be operating on the local APRS net live. I plan to have a RELAY in the car or on a nearby parking garage. Gwyn will be able to concentrate on his business, and we will have a known point of visibility for the local folks.

Bob has agreed to let us distribute the APRS disk there. He suggested we distribute 7B. We will include a special MAPLIST.GA that I have been working on that customizes for the N GA, Alabama and TN area. We'll ask for a very small contribution for the shareware disk, all of which will go to our WIDE-RELAY digi fund. We will also strongarm :) people into registering their programs. Several unregistered locals have told me that they plan to register just because of the convenience. We're working out a scheme with Bob that will allow us to give these people their numbers the following day.

We are looking forward to this activity and sure think it can benefit our local net and APRS in general. I will let y'all know how this works out.

Jeff, I thought the 55AVD also put out GGA. What I've seemed to notice is that the RMC sentences seem to get grabbed by APRS and the GGA sentences are lost in the clutter because of the frequency of output. RMA is a separate altitude output altogether, if I'm not mistaken.

## 226. SAREX callsign

From: Gerald J Creager <gerry@cs.tamu.edu>  
Date: Fri, 14 Jul 1995 08:24:41 -0500 (CDT)  
To: aprssig@tapr.org  
Message-ID: <199507141324.IAA24349@solar.cs.tamu.edu>  
Rendered body type: text/plain

The digi callsign for SAREX is W5RRR-1. It's not W5RRR. N6JLH noted someone in his area trying to digi thru W5RRR last night and let me know. It'd have to be one heck of a band opening to get from California to Houston for THAT digi path!

73, gerry

(W5RRR digi is at NASA's Johnson Space Center; W5RRR-1 is at an altitude of 161 nm)

## 227. SAREX

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Fri, 14 Jul 1995 11:01:20 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950714103601.24103A-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

Well, I figured out better ways to do the unattended SAREX mode than what I put in 71a. Hope to finish these today in 71b: (Wait for 71b if u havent gotten 71a yet)

1) We should avoid using the standard TO: APRS generic callsign!!! No sense putting such an easily recognizable callsign for a test. It will just give ammunition to the NAY-sayers who will attack us... as QRMing the normal ROBOT SAREX CONTEST mode.

FIX: APRS version 71b will use the TO call of QTH for all Grid Square modes (including SPACE) which also makes the packet appear shorter.

WORKAROUND: For 71 and later, use alt-S-MODE-altNet. Then do an alt-S-TNC to save the new call of ALTNET. Then check to be sure that controls is still at OTHER.. For earlier versions, do an O-C-T and manually type in your UNPROTO QTH VIA W5RRR-1. But this will need to be done frequently, since any UNPROTO or DIGI command in APRS will overwrite this back to TO APRS...

After watching the unattended mode, it works, but only for the first orbit and second one if 2 was the initial number of orbits. If you start at 3 or higher, then it screws up and adds N\*92 minutes to the next pass time.

OBSERVATION: I have noticed MIR using voice (in russian) with Houston on most morning passes. They go to sleep around midday (They sleep on a Moscow schedule)

Shuttle also has voice contacts, so be ready to hit CONTRROLS-X to cease transmitting packet during voice. Not a problem on SAREX which has a separate uplink of 144.49. Both MIR and SAREX downlink on 145.55.

APR REPLY: In most recent versions, you can use the alt-S-GPS-GGA command to specify GGA only so that you get GGA with its altitude and it will ignore any RMC's which it normally grabs first. At least that was my intention with that command...

## 229. Re: [APRSSIG:2251] SAREX

From: Gerald J Creager <gerry@cs.tamu.edu>  
Date: Fri, 14 Jul 1995 11:18:03 -0500 (CDT)  
To: aprssig@tapr.org  
Message-ID: <199507141618.LAA26687@solar.cs.tamu.edu>  
Rendered body type: text/plain

The early morning Mir voice contacts are to W5RRR, and they're talking to the Russian Astronauts training there, usually. Sometimes it's a chat, sometimes, it's technical. There are times in their orbit when ham radio's much more reliable than Mir-Comm.

73, gerry.

ps: Good points re: voice contacts. Please be sensitive to this. Further, if you happen to be band-scanning and hear the Shuttle doing voice ops on another frequency than 145.55, remember that this is a school or a crew-family

contact and let 'em go on.

Thanks, gerry

> time.  
>

Am I missing something: as each visibility window will be around 5 minutes,  
using unattended or automatic mode with aprs will result at most to 5  
packets sent to the shuttle, shouldn't we try with a much higher frequency  
(one packet every 10 or 20 sec?) if we want to digipeat something?

What I was thinking to do is just use a terminal program, change my beacon  
text to @FN30kw]Bernard , unproto QTH via w5rrr-1 , and if there is no voice  
qso or some packet activity appears, I fire the beacon and grab all the  
packets coming down. Treatment of the data can be done later. Sounds much  
simple this way.

Is there any minimum power or antenna requirements for this type of  
communications (never tried this before)? As the shuttle will be at least  
at 1400 km from my qth, with a maximum elevation angle above the south  
horizon of 8-10 degrees, looks like a difficult target. I have 20 watts max  
in a vertical omni antenna, is there any chance or will I just qrm for nothing?

Bernard, KB2TGH.

## 231. MAPFIX memory problems

From: jra@ag9v.ampr.org  
Date: Fri, 14 Jul 1995 10:02:03 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <199507141402.KAA31368@ag9v.ampr.org>  
Rendered body type: text/plain

I'm having trouble getting mapfix13 to load on my system. Even though I  
have something like 608k of free memory, this is what happens:

1. I load "qbasic mapfix" from the dos prompt.
2. I hit alt-R S to start the program.
3. I get the intro screen with the message to hit any key to go on to the  
help screen.
4. I hit a key, the screen goes blank, and in a few seconds I'm back in  
qbasic with an "Out of memory" message.

What am I doing wrong? The old mapfix68 didn't have this problem, but I'm  
seeing it with both versions 1.2 and 1.3

### 233. APRS on 2M FM vs. Meteor Scatter

From: Ralph Wallio <WALLIO@dsm1.dsmnet.com>  
Date: Fri, 14 Jul 1995 12:02:17 -0500 (CDT)  
To: aprssig@tapr.org  
Message-ID: <950714120217.155c@dsm1.dsmnet.com>  
Rendered body type: text/plain

TO : aprssig@tapr.org  
FROM : Ralph Wallio, W0RPK wallio@dsmnet.com  
SUBJECT: APRS on 2M FM vs. Meteor Scatter  
DATE : 14 Jul 95

I have been lurking on this net for several months keeping up with APRS developments as they apply to our Iowa State University (ISU) Spacecraft Systems and Operations Laboratory (SSOL) High Altitude Balloon Experiments In Technology (HABET) program. We foresee

supporting the use of APRS in Iowa secondary school classrooms so that students can graphically monitor HABET missions either in real time or with HABET.HST files. (APRS track history files for HABET-5 and HABET-6 are available as habet5.hst aRecent discussion of mating APRS capabilities with meteor scatter

(METSCAT) communications triggers my PTT. APRS enthusiasts who will be going to significant effort to participate in future tests should be aware that their chances of success are very slim. The 2M METSCAT QSO between Rich Zwirko, K1HTV, and myself during a path peak of the 1984 Perseids shower took 2.5 hours of constant packet transmissions using METSCAT signaling standards. Minimal packets were transmitted in alternating 30-second intervals in each direction minute-after-minute until we finally, after 2.5-hours, collected the very meager METSCAT QSO information requirements.

Digital METSCAT operations on 2M by typical 1000W EIRP stations, when using standard 1200BPS AFSK on FM, and even minimal AX.25 packet lengths, will produce almost no copied packets. Here are the problem areas:

- |            |                                                                                                                                                                                                                                                                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 144MHz     | The time constant of the vast majority of meteor trails is too short at 144MHz to allow useful data transmission. Operations on 6M (or even 10M as we approach the solar minimum) would radically improve performance.                                                                                                                              |
| Power/gain | Antenna gain of 10dBd is reasonable in that higher gain, and narrower beamwidth, would illuminate fewer trails. Success, however, will be greatly dependent on output power delivered to the antenna ... think 1000W, not 100W.                                                                                                                     |
| AFSK on FM | Inexpensive AFSK (Audio Frequency Shift Keying) demodulators in most of our TNCs require almost full quieting signals to produce copied packets. Signal strength yielding 15dB of SNR almost never happens on 2M METSCAT. Other modulation schemes, e.g., PSK and MSK (Phase Shift Keying and Minimum Shift Keying), require considerably less SNR. |
| 1200BPS    | Our usual signaling speed, 1200BPS (when using binary AFSK, 1200BPS is also 1200 Baud), is too slow for dependable success, even at 6M. Think of using 4800 or 9600BPS to radically decrease required time constants.                                                                                                                               |
| AX.25      | Even minimal AX.25 packets are usually too long. We only have control over the the number of bytes in the data field. We have very little control                                                                                                                                                                                                   |

over AX.25 packet header length (by not using digipeating addresses). Packet METSCAT protocols with considerably less overhead (and correspondingly less flexibility) have been developed. They are not, however, directly applicable to routine TNC operations.

Numerous commercial and military METSCAT networks are in operation handling routine and priority traffic. These networks are optimized in operating frequency, modulation schemes and data formats. METSCAT works, but not on 2M, not when using 1200BPS AFSK on FM, and not with AX.25. Experimenters who are interested in optimizing their stations and operating methods for successful digital METSCAT communications can take direction from these developed networks.

14th Annual ARRL Digital Communications Conference  
September 8-10th, 1995  
Arlington, Texas (minutes from DFW airport)

The ARRL Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communications Conference is not just for the digital elite, but for digitally-orientated amateurs of all levels of experience.

For further information:

> (one packet every 10 or 20 sec?) if we want to digipeat something?

APR REPLY: Yes, it will try only very briefly. and only for only a few  
mintes before it decays back to background level. This is intentional for  
UNATTENDED stations. If you are there during a pass, then use the  
CONTROLS-XMT-POSITS command to get a higher rate of packets.

I've been following this thread with some interest, as I've been looking at the commercial systems for some time now.

I think what Ralph is talking about pretty much hits the nail on the head, technically. I agree that 50 MHz is probably the ideal band, and that FM at 4800/9600 baud is probably the transport mechanism that we want to use. As far as protocol, yes, there is some overhead in AX25, but until the next version comes out, (with some sort of broadcast protocol, as I've heard) then it's about the only thing that can be widely used. Of course, if someone were to implement some sort of Meteor Scatter KISS-mode "packet protocol" program, I doubt that there would be a problem getting a STA from the FCC, (should that be necessary) vis a vis the HF STA that covered many stations for a number of years.

The biggest stumbling block is to convince the many (ahem..) frugal hams to implement 4800 or 9600 baud systems.

As I understand the commercial systems, they have an algorithm that changes the packet size dynamically based on the link quality, but does this very fast. They achieve bit rates (from my memory) of around 300-800 baud using MS communications with moving vehicles on 40 MHz. Most of their systems operate at around 1KW (probably about 6-8 KW ERP) using split-site, full duplex base stations.

There's a boatload of 100W VHF FM lowband radios out there that would be ideal for either 10M or 6M service that are available in the under-\$100 price range from a number of dealers.

## 237. Garmin 55AVD and APRS

From: jeff.brenton@espi.com  
Date: Fri, 14 Jul 95 14:24:40 -0500  
To: APRSSIG@TAPR.ORG  
Message-ID: <9507141424.0K8TW02@espi.com>  
Rendered body type: text/plain

Gerald J Creager typed, "I thought the 55AVD also put out GGA."

Well, it gets confusing. The 55AVD \*manual\* says it outputs \$PGRMA sentences, but the unit itself (when set to NMEA 0183) puts out \$PGRMZ sentences. No \$PGGGA, unfortunately, either documented or actually output...

Looking at the captured output, I have the following:

```
$GPXTE  
$GPBWC  
$GPRMC  
$GPRMB  
$GPR00  
$GPGLL  
$PGRMZ
```

They are in that order, every 2 seconds. I wish it DID put out GGA, 'cuz I'd have the KPC-3 simply report that...

## 238. APRS-SAREX ver 71b

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Fri, 14 Jul 1995 15:40:29 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950714152500.26119E-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

OK, I changed 71a as follows:

- \* SPACE mode now uses the TO address of QTH
- \* The unattended mode works for more than 2 passes
- \* I changed the default orbital period to 91 minutes. Using your orbital tracking program and deciding when to activate this mode will be crucial to un-attended success. When the timer times out, then your beacons are reset to about 4 seconds (Then they double on out as shown below)

```
P * * * * *  
B * * * * *
```

^0 min            ^1 min            ^2min            ^3min            ^4 min

Notice that the BCN and POSIT (identical packets) are each on their own and slightly different schedule, so that you do get about a 3 minute of raised activity (UNATTENDED)...

Of course if you are at your station, then hit XMT-POS as fast as you can and you will be able to produce about 1 packet every 8 seconds maximum... (still fewer than CONNECT REQUESTS!)

Im am now FTPing 7bto71b.zip to tapr.org....

P.S. Thanks to W0RPK for the insight to 2m MeterScatter. I hope you also sent it to Stan Horzempa...

Yup, you're correct. I just uncovered the manual and looked again. Really is a shame.

One of the problems I have with some of the equipment manufacturers is they implement a protocol like this and don't give the user some degree of control over what's output. trimble is one of the culprits, and Paul Evans and I have discussed. They just ship a couple of sentences out every second and that's that. At least their sentences are a little more useful, and less proprietary!

73, gerry

\*\*\*\*\*

\*\*\*\*\*

If anyone wants to hook up their 100W 6 meter FM radios for Mscat now, I will be happy to tell them what to put in their TNC unproto to transmit such packets. On the receive end, ANY APRS program will not only PLOT all stations heard, but the HEARD log will show HOW many packets per HOUR were heard from WHICH stations.

it would not take much to add in an APRS like message capability as well...  
Ralph, whaddya think?

APR REPLY: ARGH!!!!!! Based on the info that someone sent me here, I changed the packet that APRS accepts from PGRMZ to PGRMA in version 71b. The reported format for RMA seemed to match what I already had in APRS for RMZ, so I assumed that I had a TYPO and so I changed RMZ to RMA. Now APRS will look for a PGRMA. OK guys which is which. and what is the difference?

Don't know about Gerald but my (circa '93) 55AVD doesn't offer this option

Does GGA have altitude? I had thought the lack of an altitude sentence in my 55AVD was for liability reasons.

## 247. GARMIN 55AVD and APRS

From: jeff.brenton@espi.com  
Date: Sat, 15 Jul 95 00:49:13 -0500  
To: aprssig@tapr.org  
Message-ID: <9507150049.015HW05@espi.com>  
Rendered body type: text/plain

I echo Bob's "ARGH!!!!!!!"

I just put both the manual for the 55AVD and the computer capture of the actual output side-by-side. Manual says \$PGRMA, but the unit itself definitely sent \$PGRMZ sentences. There is no mention in the manual of what the formats actually look like, so I have no way of knowing if they are identical.

---

## 248. Re: [APRSSIG:2269] Re: Garmin 55AVD and APRS

From: Gerald J Creager <gerry@cs.tamu.edu>  
Date: Sat, 15 Jul 1995 08:40:18 -0500 (CDT)  
To: aprssig@tapr.org  
Message-ID: <199507151340.IAA09596@solar.cs.tamu.edu>  
Rendered body type: text/plain

Unfortunately, the 55AVD has only one flavor of NMEA-0183.

Bob, the sentences published in the manual are:

GLL, RMB, RMC, R00, WPL, XTE, and the proprietary RMA. I'll try to look at it later today and confirm those. Unfortunately, I've learned that the Garmin docs are not always accurate when pertaining to certain things...  
"Specifications and equipment subject to change without notice..."

Nor does mine.

> Does GGA have altitude? I had thought the lack of an altitude sentence in  
> my 55AVD was for liability reasons.

GGA includes altitude. I suspect it was a lack of forethought or a conscious decision rather than consideration of liability. After all, the Nav position page has it.

Rendered body type: text/plain

The experts have informed us how poor the probabilities are for 2m comms via Mscatt. I believe them, and I believe that 6m is the place to build any lasting Mscat network. But since most of us will not ever get around to setting up a 6m system with new 4800 baud protocols, maybe a 2m special event during known Mshowers would be a great HAM challenge just for fun.

In this light, how about the following plan to attack the poor probabilities with FORCE! The best chances will be had with someone transmitting maximum power, all the time, using the shortest possible packets, and everyone else listening about 500 to 1500 miles away. Here is how hundreds of us can easily participate:

- 1) We designate four areas of the country to transmit for 15 seconds each
- 2) In each area, we identify as many possible 300W or stronger XMT volunteers
- 3) To prevent collisions, these XMT stations should be no closer than 200 or so miles fm each other (closer if different beam headings are used).
- 4) XMTs send short (.2 sec) packets continuously: WB4APR>FM19SX: ^
- 5) Receive stations use APRS to plot and count all heard packets

I can easily add a MS receive and transmit mode in APRS to handle the GRIDSQUARE-in callsign packets. The experts need to advise how many XMTRs and what their spacing must be to optimize throughput without causing collision problems.

P.S. I am not abandoning 6m tho. Todays A.R.Trader has an ad for hundreds of 50.675 FSK data receivers for \$9 each. The GE and MOTOROLA columns had adds for quantities of Hwy Patrol 100 watt LOW-BAND (6m) FM radios for abt \$40 each... If someone can figure out a NETWORK plan, I will be happy to write a protocol for packing data into SHORT ax.25 UI frames!

P.P.S. Since we can run 1200 baud on 10 meters, how does that compare with 6m, 2m?

---

## 253. APRS vs. METSCAT Suggestions

From: Ralph Wallio <WALLIO@dsm1.dsmnet.com>  
Date: Sat, 15 Jul 1995 16:47:40 -0500 (CDT)

To: aprssig@tapr.org  
Message-ID: <950715164740.1dd5@dsml.dsmnet.com>  
Rendered body type: text/plain

TO : aprssig@tapr.org  
FROM : Ralph Wallio, W0RPK wallio@dsml.dsmnet.com  
SUBJECT: More APRS vs METSCAT  
DATE : 15 Jul 95

My first response to the possibility of using APRS techniques via meteor scatter outlined problems with the use of 2m, low power, AFSK on FM, 1200BPS and AX.25. This discussion is intended to be more positive by discussing methods that will improve chances of success.

#### QSY DOWN

Comments by Mark Oppenheim, KD6KQ, and Bob Bruninga, WB4APR, suggest an initial direction, QSY the effort to 6M. The 2M packet METSCAT QSO in August, 1984, between Rich Zwirko, K1HTV, and myself was sandwiched in time by far more extensive experiments on 6M. Bob Carpenter, W30TC, and I experimented with a 6M AFSK FM AX.25 METSCAT link for most of August, 1984. While Rich and I struggled to complete a minimal 2M AFSK FM AX.25 METSCAT QSO, Bob and I transferred multi-kilobyte files on 6M.

We knew our experiments on 6M were sub-optimal. Bob, W30TC, had direct professional experience with METSCAT networking, I had collected and studied a file drawer full of commercial and military documents. In that era, ingenious development of inexpensive and higher speed modems using more efficient modulation schemes, PSK and direct FSK, was under way but hardware was not yet available off-the-shelf. On the protocol side, AX.25, first widely implemented in the TAPR (Tucson Amateur Packet Radio - our host on this net) TNC-1, was the new game in town. (In that era, experiments with AX.25 networking were conducted from D.C. to daylight. Bob, WB4APR, I, and a few others were polluting the H.F. spectrum with 200Hz shift 300BPS AX.25 connections using surplus 103-type modem boards Bob had liberated.)

Given AX.25 and 1200BPS AFSK on FM, the only variables Bob Carpenter and I had to control were frequency, power, packet length and inertia. On the east end, Bob was an accomplished 6M enthusiast. On the west end, we had nothing, so the Central Iowa Technical Society went to work. Bob Evans, K0IQR, located a surplus 250W low-band VHF base station, obtained appropriate crystals and brought the beast back to life. Mike McQuiston, WA0WYW, combined a then recent QST 6M Yagi antenna construction article and the aluminum stock in his garage and managed to fly five elements in loose formation. The larger CITS group erected yet another tower, raised Mike's antenna, ran the feedlines, and kibitzed the assembly in to operation. As it happened, our preparations on the west end exactly coincided with Bob's schedule on the east end. We immediately went on the air and, before most CITS members limped home, packets were already flowing.

Hmmm, where were we? Oh yes, QSYing APRS METSCAT operations to a frequency lower than 2M is a reasonable first step. The question is, should experiments use 6M, 10M or both? When all factors are taken into consideration, 40MHz turns out to be the optimum frequency for METSCAT throughput and that is where commercial and military networks operate. One of these factors is symbol destruction due to multi-path distortion, a serious problem when solar activity brings the MUF up to 10M and higher. But we are approaching the bottom of the solar cycle and the chance of an F-layer opening on 10M, let alone 6M, is poor. (Chances for E-layer openings continue, regardless of the cycle, on both bands but, since we aren't designing for maximum throughput, most folks would probably be thrilled with packets received via any mode.)

In this era, use of either 10M or 6M would be reasonable so the band decision appears to resolve down to questions of logistics and interests. I suggest experimenters equipped with 10M rigs and antennas establish a 10M frequency and start a network. Similarly, experimenters equipped for and interested in 6M start there. On 10M, 1200BPS AFSK on FM is allowed above 29.0MHz for those with general class or higher privileges. The satellite sub-band starts at 29.3MHz followed by repeater pairs to the upper band edge. Pick a frequency between 29.0 and 29.3MHz, perhaps 29.280MHz, and begin operations. On 6M, the experimental segment 50.6 - 50.7MHz

could be used, perhaps 50.680MHz.

#### MINIMIZE AX.25 OVERHEAD

-----  
Power/gain, AFSK on FM and AX.25 overhead will still set limits but on 10M or 6M a few short APRS packets will be copied. The shortest possible UI AX.25 packet, just UI overhead with no data, is 20 8-bit bytes (octets):

|         |                                                       |
|---------|-------------------------------------------------------|
| FLAG    | (we transmit lots but only need to receive one octet) |
| ADDRESS | (112 bits or 14 octets)                               |
| CONTROL | (one octet)                                           |
| PID     | (one octet when running AX.25 version 2)              |
| FCS     | (two octets)                                          |
| FLAG    | (only one octet required)                             |

Note the lengthy but minimum address field to accommodate Amateur Radio call formats (with digipeating, the address field can extend to as much as 70-bytes). APRS operation uses UI frames in which the seven destination station bytes of the address field (only six bytes can be used) could be filled with other useful information by applying the UNproto command. Bob, WB4APR, suggests he could further implement code in APRS that would process six byte grid square designations found in displayed UI headers thereby creating APRS locating packets of absolute minimum length. Good thinking Bob!

#### CONSIDER USE OF HIGHER BIT RATES

-----  
Twenty byte APRS AX.25 packets will require meteor trail time constants of 134ms at 1200BPS, 34ms at 4800BPS, but only 17ms at 9600BPS. Inexpensive 9600BPS FSK demodulators and methods require about the same SNR as 1200BPS AFSK demodulators. Given the same SNR requirement, shorter time constants required for higher speeds would increase packet reception probabilities because the number of usable trails would increase significantly. I have lost track of the legalities of transmitting 4800 or 9600BPS FSK on 10M and 6M. Perhaps someone could fill us in.

Interfacing FSK modems to transmitters and receivers is not a plug-and-play exercise. Data modulators must drive FM transmitter modulators directly, bypassing transmit audio processing. Data demodulators must be fed audio directly from receiver FM demodulators bypassing receive audio processing. If the use of direct FSK at either 4800 or 9600BPS is legal on either 10m or 6M, the more arduous interfacing challenge could be worth the trouble.

Bob, This is a follow up to my previous msg. about the space mode always showing that a packet had been digipeated even though it hadn't been. It

turns out that this happens in all APRS modes with the PK-232. The TNC ALWAYS echos unproto packets including the beacon whenever Monitor is set >0. I have spent several hours playing with the TNC and reading the manual and can find no way to turn this echo off. It looks like the only way to fix it is for the program to ignore any echo with an \* after MYCall. ie. kk6ib\*>relay>aprs. The digipeated packet will be : kk6ib>relay\*>aprs.

I'll make a point of testing it tomorrow or Monday.

I was up for a couple of passes today, and heard SAREX well. Well enough to get QSO #184 confirmed. Never ever did see any APRS activity, though.

Couldn't the reason for the Garmins not reporting altitude be the same mentality that makes the stupid thing lock up at 90 MPH? I think they're trying to keep us from carrying it aloft so they can sell us one of the nice \$1000+ aircraft units. My current GPS-50 is my last Garmin.

Anybody got any favorites to replace Garmin with? Cheap doesn't do you

any good if Cheap doesn't work!

K4LKQ showed me his remote arrangement today. He used (would you believe) 12 FEET of RG-174 and an old mag mount modified with a BNC female mounted at 90 degrees to allow the antenna to be vertical. He says it works perfectly. Claims to get better readings, even with the lossy 174, than sitting the RX on the dashboard. It would follow from what I saw today that 50 ohms is, in fact, the correct cable impedance, and that cable loss may be less of a factor than what I would have thought.

There is nothing in the NMEA specs (that I could find) that reports altitude. I believe that is why Garmin uses a proprietary sentence to report altitude. Altitude doesn't really do you that much good in boats, IMHO. It would be nice for people SCUBA diving off of boars in mountain lakes (you have to adjust your dive times due to the different pressures) but that is such a small market that it seems the NMEA specifiers didn't think it worth while making altitude part of any official data sentence.

Loss at L band for RG-174 is significant. Like 2+dB/meter. The saving grace is the amount of signal the system provides from each satellite at the earth's surface. Tie that to a little gain in the antenna (or a lot if you use one of the Trimble actives :-) and you can afford to make that sort of coax run.

Motorola and Trimble calculate loss at L band to be 1 dB/meter, by the way.

## 264. Re:APRS METSCAT Suggestions

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Sun, 16 Jul 1995 09:17:06 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950716080540.29475A-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

Ralph outlined an excellent 6m discussion. My message pointed out the availability of lots of 100W 6m radios for about \$40 which included shipping. By using a pile of all the same brand radios, only one person needs to find the schematic and figure out the 9600 baud access points, and then we can all leech the info and be on the air with minimum time. Is there a comitted volunteer out there that wants to do that?

Similarly, notice that those \$9 FSK boards in A.R. Trader need someone to buy one and tell us if it will make a good RCVR. Is it Sensitive? What data rate does it work at? Notice they are XTALed already on 50.675 RIGHT WHERE RALPH RECOMMENDS 6m MS! Since also he says MScat works best with the XMTR transmitting continuously at one end, these stand alone receivers would be a good investment...

EXPERTS, PLEASE ADDRESS THE FOLLOWING: The most common commercial MS networks are fixed point-to-point, with both ends pointing BEAMS at the same area of the sky. They operate FULL duplex so that at each end the transmitters are pumping out RF and packets 100% of the time. This leaves the throughput purely a function of the probability of meteors in the given sky region... There is great potential for setting up such "traffic forwarding" links point-to-point. Now how do we let everyone play?

1. Set up a few transmitters full time, max power and everyone counts received packets?
2. Drop to the 100W class, everyone transmits, and everyone listens, as long as someone is always transmitting (at any instant) then someone somewhere should hear a packet via every meteor event. Im thinking as I type here, so im beginning to realize, that in a standard ole' APRS aloha network, where each person only transmits rarely, his particular chance of being seen is very small, but since everyone is doing it, then the probability of SOMEONE's pacekt getting through on any given meteor event is the same as scenario 1 above! right??

So all we have to do is know how many people are transmitting (N) and then tell them all to transmit at a rate of 1/N so that there is RF in the air at all times from someone. Hummh. And since APRS is an application where just getting one packet randomly from anywhere is kinda fun...

NETWORK IDEA: I have a PK-9612 or whatever the name is for the kantronics DUAL port 1200/9600 baud TNC. Since APRS already works fine with the dual port KAM, the 9612 works the same way, so just as we currently have KAM HF gateways into APRS 1200 baud nets, MScat gateways would work the same way!

The difference would be that APRS MESSAGES would probably be useless due to the poor probabilities, but you should see some posits make it through.

Even using it for mobile posit reporting (boats at sea) or long haul RV'ers would not be practical because of the lack of antenna gain? Ralph, I assume that when you drop back to 100W AND you loose 10dB of antenna gain at BOTH ends, you just gave up 30 dB! So does that mean that the usual statistics of 100 baud throughput drop back to one packet maybe every hour for a CONTINUOUS transmitter? ARGH! at 300W input power thats 3 cents per packet in utility bills...

## 270. questions again..

From: KD4EMI@aol.com  
Date: Sun, 16 Jul 1995 15:47:10 -0400  
To: aprssig@tapr.org  
Message-ID: <950716154709\_116057536@aol.com>  
Rendered body type: text/plain

Thanks for the responses guys.. here are a few thoughts..  
#1 Im still a bit fuzzy on the gateway stuff. I run a KPC3. My gate neighbor

runs a KAM. he wants to retransmit the local positions. His mygate is on gate, my unproto is on wide, gate. Still not getting any on the HF activity trickling down to VHF from him.

#2 I check the digi paths and notice something, NO callsigns..?  
Would it be possible to see who your getting the gateway'ed stuff from instead of just gate..? same on wide..  
All you see is gate or wide, with no clue as to who's doing it..

#3 I tried to edit MY home position. I hooked the object and when I tried to delete it or kill it, I got the digi screen or the kill screen. I can kill or delete other objects though.

#4 T.S. Chantel...  
Lets say my friend just boots up aprs. can I xmit to him what I have on the screen, (all of the storms and stations ?)  
I hit the x and then the objects, but see nothing going out.

#5 Are any of you going to Melbourne? Would like to get together with other APRS folks there if possible. Will operate GPS mobile...!  
(melbourne florida by the way)  
thanks Mike KD4EMI  
(KD4EMI@AOL.COM for private response)

## 271. Re: APRS METSCAT

From: David Josephson <david@josephson.com>  
Date: Sun, 16 Jul 1995 13:23:56 -0700 (PDT)  
To: aprssig@tapr.org  
Message-ID: <199507162023.AA00790@bolero.rahul.net>  
Rendered body type: text/plain

Hello APRSers,

A couple of data points on the meteor scatter idea.

100 watts is probably enough, with good antennas. \$40 is a fair price for those radios if they are late model 6m radios. There are tons of Micor 110 watt mobiles around California, pulled from Calif Highway Patrol cars, at prices from \$10 to \$200 depending on who's selling. They have dual receivers, one can be taken out and used for a stand-alone. I have an extra manual on these if someone is going to get a pile of them and do such a project -- which I would recommend. The receivers are also very good, very high sensitivity and equipped with the Motorola IF noise blanker. Crystal-controlled VHF radio design doesn't get better than this. If you're in the Palo Alto area, there are about six of them available in the \$30-40 price range at one of the disaster service organizations who got them from CHP and found them too big for their uses, contact me for info on who has them.

The other point is that ARPA (formerly DARPA, Defense Advanced Research Projects Agency) funded a major met scat project a few years ago that achieved a few tens of baud throughput from a 100 watt mobile nearly all the time, year around, and a few kilobaud throughput between 5-10 kw base stations also nearly all the time, over ranges of 100-2000 miles. One end of the link has to be the high power base, to send acks to the mobile with at least the probability of getting through as the mobile has. The advanced logic required for this was no doubt very expensive when it was done on a mil spec r&d project, but is probably doable with a fast PC now. They operate on a frequency near 40 MHz, so 6m isn't too far off. I think they are pretty sure that's the optimum frequency. I have met one of the project managers for this at ARPA while discussing another project, and it's entirely possible that we could get a full set of documentation on how it's done. I haven't pursued this because I simply don't have the time, but if there is a group of people that has the background, time and energy to put into this aspect of it like Bob has in the basic program, I'd be happy to set up the contact.

> GGA includes altitude. I suspect it was a lack of forethought or a conscious  
> decision rather than consideration of liability. After all, the Nav position  
> page has it.

Sounds like a good conspiracy theory. (I couldn't resist).  
The exact structure of the GGA sentence is:

GGA - Global Positioning System Fix Data

Time, position and fix related data for a GPS receiver.

\$--GGA,hhmmss.ss,llll.ll,a,...

```

|      |      |
|      |      | +-----\N/S North or South
|      |      | +-----/Latitude
+-----UTC of position
```

yyyy.yy,a,x,xx,x.x,x.x,M,...

```

|      | | | | | |
|      | | | | | +-----\Units of antenna altitude, meters
|      | | | | | +-----/Antenna altitude above/below mean-sea-level geoid
|      | | | | | +-----Horizontal dilution of precision
|      | | | +-----Number of satellites in use, 00-12,
|      | | | may be different from the number in view
|      | | +-----GPS quality indicator [1]
|      | +-----\E/W East or West
+-----/Longitude
```

x.x,M,x.x,xxxx\*hh<CR><LF>

```

| | | |
| | | +-----Differential reference station ID, 0000-1023
| | +-----Age of Differential GPS data [2]
| +-----\Units of geoidal separation, meters
+-----/Geoidal separation [3]
```

[1] GPS quality indicator: 0 = fix not available or invalid  
1 = GPS fix  
2 = Differential GPS fix

[2] Time in seconds since last SC104 Type 1 or 9 update.  
Null field when DGPS is not used.

[3] Geoidal Separation: the difference between the WGS-84 earth ellipsoid  
and mean-sea-level (geoid), "-" = mean-sea-level below ellipsoid.

## 273. APRS-SAREX next-pass-mode

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Sun, 16 Jul 1995 20:15:38 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950716200150.29991D-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

Well, everyone knows the period of the shuttle is about 90 minutes, so that is what I put in the next pass algorithm for boosting APRS activity during the "next" pass. Stupid me. I forgot to add the time about 4 minutes or so that the earth rotates my position in the same time! So if you are using the UNATTENDED mode in APRS71B, it will work at the specified time for the "next" orbit, but it will only add 91 minutes for each additional pass instead of 95. With this 4 minute error, then you need to aim for the one pass you really want to hit for sure by accounting for this error.

We see 3 passes up here at 40 degrees latitude, so to hit the 2nd pass dead on, I should add 4 minutes to the time-to-next pass for the first one. This will make me come on toward the end of the first pass, hit the middle one as intended, and come on early for the last one.

With the "early" morning passes, this mode is the only way some of us will be able to have a chance at hitting the robot digipeater... I will have a new 71c posted Monday that will fix this accordingly for anyone

operating in the unattended mode....

Does anyone else have any bug reports for the SPACE mode??? Still, two days in a row, i get home and notice that my office APRS has the wrong unproto path for SAREX! DID I foregt to set it both Friday and Saturday when I left the office? Or is it resetting itself to WIDE,WIDE on its own???

Date: Wed, 26 Jul 95 07:44:04 UTC  
To: aprssig@tapr.org  
Message-ID: <26902@w8dc.ampr.org>  
Rendered body type: text/plain

I thought i saw a post about someone remoting a Garmin 45 antenna using coax... My question to you APRS'ers is, has anyone found a resilient antenna, similar to the active antennas I've seen sold for use with the Garmin (or any BNC equipped unit). The little L-shaped antenna that comes with it is OK, but a dome type antenna with a mag mount would be great, especially at autobahn speeds...

Ron - KC8UX@W8DC.AMPR.ORG or KC8UX@MSN.COM

Unfortunately, no. But with a little investigating (watching S-Meter and incoming packets, swinging the beam, ...etc) you'll figure out what's coming from where.

<SNIP>  
>#4 T.S. Chantel...  
>Lets say my friend just boots up aprs. can I xmit to him what I have on the  
>screen, (all of the storms and stations ?)  
>I hit the x and then the objects, but see nothing going out.

Yes there is but it's intended for the DX cluster mode....and could wreak havoc on the APRS net. It's not documented but Bob might give you the details to experiment.

One option would be to copy your backup.bk file into the text of a message in the PBBS of your TNC. You and he could cut/paste in a few keystrokes. It's not convenient and would chew up some air time...but an idea.

The X-Objects feature transmits objects YOU are uplinking, that is, those things you've put on the map. If you're not uplinking anything, nothing goes out. In general, the X gets you to a menu asking which of \_your\_ station data to transmit: your posit, your beacon, your messages...etc.

Rendered body type: text/plain

Did I see someone a few weeks back say they were working on a web page about APRS? Or some mechanism where casual browsers could check in and see what APRS is about without having to burden the SIG with the

inevitable question.. What is it?

If you are, or know of a way to, then mail me direct. Thanks.

## 277. APRS DF hunt #3

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Mon, 17 Jul 1995 00:11:49 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950716231813.439A-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

Last weeks success with a smooth 12 mile drive to doppler find the fox only 8 miles line-of site from the start gave this neophyte a skewed view of DFing. This weeks event was a lesson in humility.

Working on the clothes dryer with 3 wash loads backed up, I was surprised to earn my wife's blessing to run off to a fox hunt I had only learned of a few hours earlier. Only 2 teams showed up at the start and both were APRS equipped. N6QAB has a white step van dedicated to DFing which would be the envy of the FCC! My bomb of a mazda and maze of duck tape is just plain an embarassment. But hey who has time to make it pretty. Here are the lessons learned:

- 1) why would a stand-alone tracker which has worked flawlessly for 3 years suddently output only 00000,00000's?
- 2) Why would the author of APRS try to lash up and debug a GPS/DF suite parked under a thick canopy of trees? A: 100 degree heat
- 3) How long does it take to re-init a GPS from scratch?! A: (20 mins +)
- 4) How can you leave the start point when you cant hear the FOX at ALL!
- 5) How many directions are the wrong direction to start a search? A: 3
- 6) Why would anyone use his HT as the Doppler radio without bringing along a DC power cable for it.
- 7) How long does a 3 hour laptop battery last? A: 1 hour
- 8) Why would your mobile rig not hear the fox direct when the doppler HT is hearing it fine? A: Maybe thats why the repeater is so lousy in my neighborhood....

I spent the first hour trying to find anywhere where I could hear the fox at all. Then the laptop died. When I finally began to get doppler readings the HT battery died. DFing on signal strength alone with the mobile rig was not my idea of fun considering the busted dryer and stack of laundry at home. Fortunately, N6QAB had already found the fox and dropped by my intersection to replay his track history. It looked beautiful until he got within 1 mile and then his GPS data stopped.

CONCLUSION: 1) The APRS DF bearings shown on Kevins map (and presumably observed by others on the air) certainly appeared to box in the fox. Although errors of 30 or 40 degrees were not unusual, the errors seemed to be off randomly either side of the fox location. But as the distnace to the fox narrowed, the area indicated by the crossing DF bearings also shrunk (with the fox in the middle). Too bad his GPS quit working for the final mile of close in work! This confirms that APRS can take manually entered RELATIVE bearings and apply them to the vehicle heading.

2) Kevin was a relative newcomer to APRS and in my trying to explain to him over the air the features and differences between the INPUT MY, INPUT-DF, INPUT-SAVE and INPUT-UPLINK commands, even I was getting confused. (Oh yes, turns out he was running 71 where the I-S and I-U didnt work anyway!

3) Since my MFJ TNC generates enough noise to wipe out 20 dB of noiee floor, my APRS map (while it workded) only showed kevin, myself and a local home station as a digi. I was surprised to finally see Kevins screen and P list which was full of the usual 80 other stations from Connecticut to Virginia and from Florida to Arizona (via the gate). No wonder he was confused! LESSON: Use another FREQ, or use IGNORE mode!

4) I will write a checklist!

5) His track history will be called DF-FOX3.HST in future distros

>Did I see someone a few weeks back say they were working on a web page  
>about APRS?

I sent this to the SIG, because I felt it contained useful info.

Bob- My Web page ( <http://www.mindspring.com/~rwf> ) has got links to my archive of APRS files. The programs can be downloaded from it. I mentioned once about doing something else prettier about it, but then got sent out of town.

If you want to give me a "FAQ", or anything else you'd like to see up in lights, I'll be glad to HTML it and put it on the page. My pages are already pretty well known due to their ATV and Balloon focus, and is mentioned over on the GPS newsgroup in Usenet quite frequently. You can even see a picture of me there (do it on an old computer, so you won't cry when the monitor tube breaks).

I never had good luck remoting the antenna. I tried a piece of RG58 and then RG8x. 10 ft was too much loss. 8 ft was fair, but the loss seemed to outstrip the gain realized by putting the antenna outside.

For reliable 24 hr operation, I really feel you should use an external, active antenna. I do, on the tracker in my car (it is in the back window, actually) and it is always reliable.

And you probably don't need to worry about using the Garmin 45 at Autobahn speeds, since they cleverly engineered it to stop reading out above a speed of 90 kts or so. Nice marketing trick to force you to buy the aviation version for twice the price.

By the way, the L shaped one is called a Quadrifilar Helix (I think I spelled that correctly) and one of the ARRL antenna books tells how to make one. They are not simple. The one in the Garmin is on a flexible piece of circuit board and rolled into a cylinder. Don't drop it from a moving car at 30 mph. It will mess up the antenna :) Believe me- I know from experience!

I was overshipped on some Motorola active mag mount antennas, so I was selling them to some folks on the SIG a while back. They are all gone now, though.

>FREQ there) but since they all come with .01, nobody needs them there! hi hi  
>  
>

At the Atlanta Hamfestival, I met Mr Martin F Jue (the MFJ of MFJ) and his  
engineer, Mr Pan. I wanted to take Bob's suggestion of "bugging" them about  
the data radio.

As Gwyn said back in May, they truly do get a good break on the 5.01 xtals  
because of the quantity they buy. But Mr Pan asked me to ask you folks  
about this: What if the radio cost 10.00 more, but had 145.79 xtals in it.  
I think that makes it 129.95 or so. Would we buy it? Please send me your  
thoughts (Email to [rwf@mindspring.com](mailto:rwf@mindspring.com)). I will forward them on to the MFJ  
Company. This radio looks like it will be good for trackers.

Rendered body type: text/plain

Hey Phil,

Thanks for the message. Curious as to what firmware version you have in  
the Garmin 45 and what you think of its reception. WE bought 20 last October  
(Version 2.24) and they are nearly useless. I called Garmin and the Tech said

there should be no difference in the reception but he also told me to get the Serial Numbers to him and he would send me a Return Authorization so they could check them out. It doesn't seem like they would do this just to see if there was a problem since they are all still in warranty. I believe they know there is a problem and know how to fix it. At least I hope they do.

Got lots of good suggestions and following several leads. Just created a GPS committee in Pierce County, so I will have some help, and will be meeting at the Department of Emergency Management tomorrow.

We do intend to use our 45's & 75's but would like to have some compact ready to go units also. Want to get these as small and dummy proof as possible.

As for Line of Site, we have the same problem in the Cascades as you do in the Olympics. We have access to several mountaintop sites and also carry portable repeaters in the field with us. Also intend to have each individual units TNC digi info heard. Still working on the collision problem.

We are just starting and have a long ways to go. Would like to see something in the field this summer. Hope to meet you and work on our mutual problems.

M/A-Com makes 'em. As well as any number (OK, so it really is finite and somewhat limited) of advertisers in GPS world.

Later today, I'll get out the notebook and get the M/A-Com references for active and passive antennas. They do make 'em with mag mounts as well as other mechanisms of mounting.

What I did on the Cows In Space boxes was to make the MYcall unique with each TNC and put the appropriate callsign in the BText, then make the thing beacon at intervals appropriate for the letter of the law. It got me around a worrisome problem.

## 285. APRS-SAREX score card

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Mon, 17 Jul 1995 09:33:46 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950717090536.2190A-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

So far, only ONE APRS packet has been seen via SAREX. Although this may appear to be dismal, we have no idea how many SIG members are trying. In fact, a low number may be to our advantage in showing that APRS certainly cannot be considered to be a significant load on the SAREX robot.

At the close of this mission, I will need feedback from EVERY member of this SIG regarding your activity levels. I hope you are keeping a log of which passes you were ON but passive (normal beacons about every 10 mins), attended and ACTIVE, or were in AUTO-UNATTENDED mode. WAIT TO SUBMIT these reports until I REQUEST them and give an exact format.

In the meantime, report all UI frames detected, worldwide!

If you cannot attend your station, then ENLIST another APRS station who will be home during passes. He does NOT need to be a subscriber to this list. He will report his results to you, and you to us

M/A-Com also makes the connectors used by some (several?) of the GPS vendors. However, I am having trouble trying to buy some of these. M/A-Com says talk to their dealers, the dealers don't know what I am talking about..

Anybody have any good contacts as to where to buy M/A-Com stuff?

Rendered body type: text/plain

In response to RWF's query about paying \$10 extra to get an MFJ 9600 baud capable radio already on 145.79, YES I AM HAPPY to pay only \$129 for 145.79 built in! In fact, I was gonna buy a few... but wanted to query the SIG one last time for user feedback. Haven't heard a peep from anyone since the initial grumbling about shipping delays.

My concern is temperature stability. Mine will go to WIDE-RELAY sites and they better be on freq in the dead winter and HOT summer!

If you are replying with your opinion on the \$10, please respond directly to Ralph, only reply here, if you have a MFJ 5 watt radio, and have feedback. TNX.

Rendered body type: text/plain

In reply to the station that was seeing <UI> on every line fm his PK-12:

You should change BBSMSGs to ON in the APRS\SYSTEM\InitAEA.TNC file. Some of the early PK-12's didn't do monitor mode correctly unless they had BBSMSGs ON.

In fact, I remember now, that the UI display WAS the reason that you had to do this..

Rendered body type: text/plain

I am having excellent results by remoting the Garmin GPS-45 antenna using a Radio Shack window-clip mount BNC adapter. It has 6-feet of RG-58 with a BNC on the bitter end. Just attach it to the GPS-45, close the window on the adapter part (you do have air conditioning, don't you!?) and attach the GPS-45 antenna to the window clip's BNC connector. Sorry, but I don't have the model or part number case it's been long thrown away.

I also used a 90-degree angle adapter so the antenna would stand upright and even put a small plastic sandwich bag over the whole thing in case of rain. Works great. I know nothing can prevent signal degradation on tree-lined roads etc but I usually have 5-6 birds acquired and all 8 when out in the open. I'm sure there is considerable attenuation, but it doesn't seem to hamper my operations.

Just had to throw this in for info as I see so much discussion about it. Give it a try... it's only \$10 !!

Have fun de Boyd

Message-ID: <Pine.SUN.3.91.950717100602.2190F-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

On Mon, 17 Jul 1995, K7QQQ commented on his concern for collisions when all mobiles digipeat through each other:  
.... . Also intend to have each individual units TNC digi info heard. Still working on the collision problem. ...

The collision problem occurred to me this weekend as I was pondering the conversion of all of our WIDE digipeaters to WIDE-RELAYS... Now the purpose of mobiles running APRS VIA RELAY,WIDE is so that mobiles on the fringes can get injected into the network whenever they come near another APRS home site.

The problem is, what happens whenever a group of APRS mobiles all converge at a HAMFEST or other event! Everyone of them will digipeat each others packets! Unfortunatley, the only answer is operator TRAINING!

Here are some guidelines for controlling this problem:

1) High power (25-50 W) mobiles should routinely run APRS VIA WIDE,WIDE instead of the initial RELAY hop

1.5) Stand-alone trackers should probably not have the MYAlias of RELAY.

2) Converging mobiles should CHANGE to APRS VIA WIDE,WIDE or if they are low power and WANT to be seen at the event, then they MUST choose a high power mobile BY CALLSIGN to digipeat thru: APRS VIA N3XYZ,WIDE

3) Organized gatherings should designate ONE unit, FIXED or MOBILE to be the designated path. I suggest he set his MYAlias to CZAR. He will announce his status as CZAR in his BTEXT and POSIT so that others know of his existence... (I will modify APRS to display CZAR stations in RED)

4) Converging mobiles should change their MYAlias away from RELAY to something else. An instant way to do this is to hit CONTROLS-BANDS-HF. This change to HF will have no effect (unless you have a KAM) but it does change your ALIAS to ECHO!  
I will make a new COMMAND to do this MYAlias to ECHO conversion for converging mobiles...

IS THERE AN AUTOMATIC WAY TO CONTROL THIS PROBLEM?

1) Lets invent a new GENERIC digipeater address of CZAR.  
2) Anyone anticipating a convergence of mobiles sets up a LOW power DIGI with the alias of CZAR at the site of the event. (or, one mobile changes his alias to CZAR)  
3) APRS includes a function that whenever it HEARS a CZAR direct, AND is in a GPS mode (meaning its a mobile), then it will CHANGE its unproto path to APRS via CZAR, or maybe select some previously stored OPS-DIGI path of CZ.

HUMMH>>.... Although in some scenarios this would do the job, it could also prove to be a mess, because now you have just as much chance for operator error in NOT restoring their UNPROTOS on departure...

Also, since you cannot read signal strnegth, one lucky CZAR packet heard could shut down a mobile still quite far away. FOr now, then, Im not going to do anything, but if you have an idea, lemme know.

Out here on the Left Coast, Pennstock is a good place to deal with. They carry M/A-Com, Mini-Circuits, etc. They also handle small orders (which unfortunately for this stuff, still end up being quite expensive!) They're located in Sunnyvale.

Buncha stuff omitted...

>P.S. I am not abandoning 6m tho. Todays A.R.Trader has an ad for hundreds of 50.675 FSK data receivers for \$9 each.

The price is right, but I'd be leary of the sensitivity/selectivity of such recievers (especially when on an outdoor antenna/beam). And since successful decoding of FSK/MSK is a bit dependent of your receiver being accurate (to keep signal passband centered on your IF filter), this may be a problematic radio, but for \$9.00, it may be worth getting one or two and doing some basic testing.

>The GE and MOTOROLA columns had  
>adds for quantities of Hwy Patrol 100 watt LOW-BAND (6m) FM radios for abt >\$40 each... If someone can figure out a NETWORK plan, I will be happy to >write a protocol for packing data into SHORT ax.25 UI frames!

Not a bad price, but remember, most Motorola radios use -not just bare xtals- but "Channel Elements" where the xtal is installed in. Just so no one is shocked by the price, if you have a channel element, the going rate for installation and temp comp. is about \$33.00 each from International Crystal (the only xtal house I use) in Oklahoma City. Still this brings the price for a 100W radio to only \$106.00

>P.P.S. Since we can run 1200 baud on 10 meters, how does that compare >with 6m, 2m?

Well, most of the hams in the USA are using AFSK on 10M. This still is affected by path noise, fading, etc. PSK (as used on the low-speed PACSATS) is MUCH better, gosh, I've used this overseas and been able to decode packets on SSB that barely move the S-meter out of the noise, and using TXD as low as 120ms, but being a phase-domain modulation, if there's phase shift on the signal, you're back to zero. Perhaps Ralph or one of the other MS experts can calculate what the phase-shift will be on a MS burst, but I suspect it may be horrendous! (or, perhaps not)

Overall, I think that this may be a three phase project:

Phase I:      Use "generic" APRS at 6M using 1200 baud AFSK \*  
                 With a few coordinated high power >300W ERP  
                 Stations  
  
                 (Proof of concept of ham-MS)

Phase II:      Transition to 4800 or 9600 Baud on 6M  
  
                 (Proof of concept of higher data-rates being better)

Phase III:     Move to a new generation of software; APRS or a  
                 MS-specific program, perhaps in conjunction with a  
                 STA that would permit 4800/9600 baud at 10M  
  
                 (Demonstrate usage in a "real" network environment,  
                 perfoming tasks, and not just as a "demonstration")

\* Personally, I'd rather not start by using AFSK, but rather, 4800/9600 baud. However starting at 1200 baud AFSK will enable the maximum amount of hams to start experimenting with this mode in the minimum amount of time. AFSK users should be required to install and use hardware DCD boards in their TNC, and to operate open squelch (or connect directly to the discriminator, this will also enable them to transition to FSK modes -at least for RX- easily).

>  
>

Regards #1: I haven't a clue except to say you can only receive HF packets that are transmited GATE,WIDE if your friend's gate is set to mygate. I presume you don't have gate filtered out.

Regards #2: The digi list just stores what it sees sent. But, you can get a good idea of the current HF paths by checking the Heard list (H) or the Latest Beacons (L)

Regards #3: You can't kill yourself...its against the law in most states ..hi hi...reality check...you can only move your station or change its designator....you cannot remove yourself entirely except by rebooting the system in non-registered mode.

Regards #4: If you wish to uplink an object sent by another station, go to the positions screen (P), find the object, place cursor over object, and press <Enter> followed by <u> for uplink. However, please don't do this on HF as it will effect the entire country if you do.

Hope this helps.

Kevin Heyboer KD4UYR

.....remember, there are no basements or storm cellars in Florida.

Or II-Morrow when someone crashes while trying to do an ILS approach with a non-TSO'd (approved) Loran. Or Pep Boys Auto parts the first time someone crashed a plane that was found to have a Ford replacement voltage regulator rather than the functionally equivalent "official" TSO'd regulator.

Why would Garmin be liable for someone using a Marine GPS to navigate an airplane. They have no control over that.

IMHO Garmin did it solely as a marketing maneuver.

Ralph.

Yes, these will all be channel element radios, but (especially if people are doing a bunch of them as a coop project) it needn't be so expensive. You can buy just the crystal, from International, Marden or others, for about \$12, and solder it in to the element yourself. Worst case will be a variation of about +/- 4ppm over the range -10 to +50 C.

My guess is that there would be too few contacts at this power/modulation efficiency ratio to prove anything.

You can probably start just with direct FSK, something really simple minded like connecting the data line drivers to a varactor on the crystal osc.

Hmmm Seems like a good deal... and an even better one  
(for probably 4x cost ??) would be an integrated TNC and  
GPS rcvr... (w/ xternal antenna).... now that would be a good  
deal !!!!

just a comment...

sadowskp@usafcrqs.nellis.af.mil  
Al AH6LS

>something.  
>If you can describe a bit more your problem I can have a look this evening  
>at home with my PK232.  
>  
>Bernard, KB2TGH.

I found the problem thanks to Bernard's note. Cockpit error! It turned out  
that there  
is an obscure command in an update to the TNC's ROM that is called: MXmit .  
I had  
this set to on and it echoes all transmitted packets as if they were  
received off the air.  
There is no problem with the APRS software.

I wonder how many more new commands I've missed? <grin>

Thanks to all,

Barbara KK6IB

Rendered body type: text/plain

I just posted (ftp) APRS71c.zip. It is ONLY the EXE file and THE ONLY  
CHANGE is that it correctly adds about 95 minutes to each successive  
shuttle pass time rather than the 91 I was using before.

Only bother to get this file if you will be running un-attended  
APRS-SAREX over the next 3 days. Actually the passes are so early in the  
morning now, that you can usually get the first 2 before leaving for work.

C0me on guys, only 1 APRS packet digipeated by SAREX so far!

No, this isn't exactly true in all cases.

The components in the element are compensated for the crystal inside, and  
are matched to track that crystal as the temperature and voltage fluctuates.  
If you have components that track in one direction, and a crystal that  
tracks in an opposite direction (or at a different rate) then you're more  
than a KHz off-channel, even at 50 MHz.

The cost of a compensated crystal in the element far outweighs the trauma  
that you'll put yourself through if the xtal does not track correctly - much  
more important at 9600 baud FSK than, say, in an 1200 AFSK environment. As  
you start going off frequency (in TX or RX) the signal in someone's receiver  
starts being affected by the group delay in the IF passband filter (at  
filter edges) and your BER goes through the roof.

At first (15+ years ago) \*I\* "cheaped out" too, and thought that this would  
be acceptable. It was not - and all xtals finally made it back to ICM with  
their respective elements. That's why I use International - they do good  
work, they're not much more money than the competition, don't lie about  
delivery dates, their stuff works every time, and it's guaranteed for life -  
no questions asked.

Mark

I have collected (and made a few) about 24 different maps of Illinois and surrounding areas, written up a maplist.il for those maps, and uploaded them all in a file call ILMAPS01.ZIP to both my BBS and ARN BBS.

If someone would be kind enough to upload them to TAPR.ORG for others to gain access via internet, it would be appreciated.

When I went to fix the overnight timer in the SPACE MODE, I found that it was NOT broke in the firstplace. When you say the next pass is enough hours away to go past midnight, the timer is active and ready to go, only the SPACE MODE display was confused and not showing the time-to-go. As soon as midnight rolls around, the negative number will "come out of the hole" and everything will work fine..

This will keep you from having to stay up till midnight to set the timer for the 5 AM pass tomorrow morning. This will work in both 71b and 71c. If you have 71b whos only bug is that it only adds 91 minutes instead of 95 minutes for the 2nd pass, simply set the timer in the evening for the first pass, and then in the morning, reset the timer again yourself for the next 7 AM pass.

### 306. Re: [APRSSIG:2299] Garmin 45 & External Antenna's

From: rkramer@vaxxine.com (Ronald Kramer)  
Date: Mon, 17 Jul 1995 20:19:25 -0400  
To: aprssig@tapr.org  
Message-ID: <9507180019.AA24252@alpha.vaxxine.com>  
Rendered body type: text/plain

Well let's see..

Garmin 45 on dash of Safari 4 or 5 sat's very directional  
Garmin 45 on console below dash with Radio shack suction cup 6 ft extsion antenna in front window defogger to hold upright, suction cups will not stick to dash, 5 or 6 sat's still very directional, mount antenna on front glass window half way up, only way to mount vertical is to face top of antenna down, does not hardly work at all upsidedown.  
Use original Raytheon 900 gps active antenna 30 ft rg 58 couple of connectors antenna on top of rear roof, 7 to 8 satelites most of the time, full scale on signals most of the time, this antenna is about 10 inches high and has to be removed or layed over to enter the garage.  
Purchase Garmin GA28 active antnna, about 30 ft of rg58 white, very good quality coax well shielded good stranded centre conductor.  
The antenna proformed well although it is directive, you can rotate it and the signals go up and down and change sat. very much.  
Why do all these companies insist on using straight thread... can not find die to make mount, force a NPT die in split housing a bit but can fix once mounted with silicon. Mount a pipe nipple to magmount and antenna to that about 6 inches total height will go in to 7 ft garage door without getting out to take off or fold over.  
Thinking about turning up antenna one day forgot to wait for garage door to be fully up scaped back 6 inches of rear hatch and glass and twisted garage door, 7 week old 1995 Safari 2 month old garage door.....  
Garmin 28 on top of rear van works good.  
Noticed that when the APRS 144.390 45 watt keyed up that the sat. signals would lower slightly and recover ok.  
Have two dual band antenna's glass mounted on either side of rear side window's one is for the GPS 2 meter IC 28h and the other if for the IC3200a Voice radio. GPS antenna is center of roof at rear most point just in front of top stop light. VHF antenna's are about 3 ft futher

forward than the GPS on either side.  
Well now all seemed to work good for about 6 days then the signals started disappearing from the Garmin 28... Guess I blew it... don't work at all now.  
Have on work bench, took plastic cover off, pried the glue apart. What a job to unsolder the coax from the .01" thick groundplane pc board so that I could check it out.  
The physical layout is a fiber pc board .01" thick with very stiff groundplane on top and surface mount components on bottom.  
Groundplane measures 2.6 inches front to back and 1.87 inches across.  
On top of the ground plane is the antenna, it is a square box about .235" high and 1.4" square. The top looks like an X from corner's to corner the X is insulator, .050" wide, so that you have 4 antenna's connected at the corner's. Centered on the sides you have a wire going straight down to the circuit board below .08 in from the edge, this is the feed point for each of the four antenna's.  
On the bottom (surface mount side) the opposit sides are connected together with matched length's of copper foil, side to side and back to front. These pairs are then cross tied together with foil tuned lines, going to a Filter and transistor. Have not fully taced out circuit yet but will sometime later on. Looks like a voltage regulator, two transistor's besides the RF transistor and a 8 pin and a 6 pin surface mount ic., about half a dozen surface mount caps.  
That's all I have to report at this time, BTW the Raystar 900 antenna is back on the van and have not damaged it with RF in 6 months of usage.

You don't have to fly to be dangerous. When I first bought a Garmin GPS-45, I was fascinated by the moving track display. I strapped it to the top of my steering column and drove with the display in front of the speedometer. Why look at the road when you can watch the map? I got the clue when I finally drove off the road and into a ditch. No damage except for a ruined wheel alignment.

Well I started the thread speculating on why no altitude data in the 55  
AVD NMEA output and the only thing I can think of is perhaps they didn't  
want you to feed its useless (for navigation) altitude indication to an  
airplane autopilot.

A precision approach sans a glide slop must be a hell of a trick even with  
a TSO'd GPS or LORAN but I digress as I drift way off topic for an APRS  
mailing list :-)

Here's an on-topic one for you space guys: Can (have?) accurate fixes  
be/been taken by a GPS aboard the space shuttle?

I used to think so ... then looked at some of the information that GE  
used to provide on this topic. They claim that all crystals drift with  
temperature in the same direction, just with different slopes. That has  
also been my experience, for what it's worth.

> The cost of a compensated crystal in the element far outweighs the trauma  
> that you'll put yourself through if the xtal does not track correctly - much

That may well be true, and I can't argue with International as the vendor  
of choice.

Subject: [APRSSIG:2310] APRS-SAREX score card

with 2-5 minute windows twice a day that's not to surprising.  
Good Luck to all and maybe next time it'll go better.

Don't know if GPS is used for shuttle, but I'm working on an ocean monitoring satellite that will navigate solely by GPS. There have been a couple of spacecraft recently which carry GPS for auxiliary navigation as an experiment, but I believe mine will be the first to use it as the only on board nav system. We carry two Motorola units and have done a lot of simulation and modeling using data from one flying now in an experimental mode, and expect no problems. We were thinking of using the Garmin 45 but had trouble keeping the spacecraft under the speed limit :-). Our only back up is to use the Air Force's NORAD skin tracking. Hope the Cold War keeps them in business.

Yes. Penny Sanders at JSC (Maybe I should get \*HER\* on this list?) has been working with that for about 4 years and had good results. Tom Clark can speak to this, or any of the AMSAT folks working on P3D's onboard GPS system, but I believe you have to take the raw pseudorange data and resolve the altitude ambiguity external to the GPS.

Rendered body type: text/plain

In the few days of SAREX remaining we need to take advantage of every opportunity when SAREX packet mode is on. If you cannot attend your station, then ENLIST another APRS station who will be home during passes. He does NOT need to be a subscriber to this list. He can report his results to you, and you to us. If you are new to SPACE, review the notes on Doppler shift at the bottom of this message.

| DAY  | TIME | ZONE | STATES | REPORT                                   |
|------|------|------|--------|------------------------------------------|
|      |      |      | SEEN   |                                          |
| Thur |      |      |        | Launch, no activity                      |
| Fri  |      |      |        | voice comms general QSO's reported       |
| SAT  | 0835 | EDT  |        | SAREX packet heard in MD                 |
|      | 1005 | EDT  | NC     | W4NMK seen in MD!                        |

|      | 0708 | EDT  |        | MIR: packet BBS seen in NC               |
|      | 0720 | EDT  | MD     | MIR: G3ZCZ non-APRS UI gridsquare (FM19) |
|      | 0838 | EDT  |        | SAREX packet! no APRS seen in MD NC      |
|      | 1013 | EDT  |        | SAREX open VOICE QSO's heard in NC,TX    |
| MON  | 0537 | EDT  |        | SAREX packet! no APRS seen in MD         |
|      | 0712 | EDT  |        | SAREX packet! no APRS seen in MD         |
|      | 0847 | EDT  |        | nothing heard                            |
| TUES | 0540 | EDT  |        | no packet detected                       |
|      | 0715 | EDT  |        | voice comms gneral QSO's                 |
|      | 0852 | EDT  |        | no packet detected                       |

If you observed something different or saw ANY UI frame, please EDIT this list and send it back.

Version 71c fixes the 91 versus 95 minute predictions used in the un-attended mode...

Since some APRS users may be new to SPACE, the following paragraph details the way to work with the doppler shift which can be as high 3 KHz. This shift is enough to wreck a packet:

|               |                          |                       |
|---------------|--------------------------|-----------------------|
| APPROACHING   | TUNE RECEIVER 2 KHz high | Tune XMTR 2 KHz LOW!  |
| CLOSEST POINT | TUNE RECEIVER on freq    | Tune XMTR on freq     |
| DEPARTING     | TUNE RECEIVER 2 KHz low  | Tune XMTR 2 KHz HIGH! |

For overhead passes, the transition is nearly instantaneous  
For horizon passes it is almost a continuous straight line.

IF YOU CANNOT TRANSMIT SPLIT MODE, then operate ONLY ON frequency.  
Since the doppler is opposite on transmit and receive, If you shift for receive, then you are making the XMT impossible!

Good luck...

---

## 325. Quincy Illinois Map

 > opportunity when SAREX packet mode is on. If you cannot attend your

Remember that the UPLINK is 144.49 and the DOWNLINK is 145.55. Transmitting  
 on 145.55 will not yield any packets.

WASNOM at JSC tells me he has observed NO APRS activity in Houston. Gil's the  
 one who programs up the TNC for each mission. He reconfirmed this morning  
 that EITHER W5RRR or W5RRR-1 will work (callsign is W5RRR-1, alias is W5RRR)  
 for unproto digipeating.

> Since some APRS users may be new to SPACE, the following paragraph

>  
 > For overhead passes, the transition is nearly instaataneous  
 > For horizon passes it is almost a continuous straight line.

NO!

For overheard passes the doppler is most pronounced. For low elevation  
 passes, the amount of perceived doppler may be small enough to not be a  
 problem.

For all passes here, I've copied packets (but no APRS packets) on all SAREX  
 passes where packet has been active. I have not shifted off-channel. My max  
 elevation has been 51 degrees. It's been more a challenge to follow the bird  
 with the yagis than to worry about doppler shift.

One possible concern here is in the APRS Stations uplinks. I wonder how many  
 folks have checked their deviation on their transmitters when operating with  
 packet? A lot of terrestrial users dial their deviation up too hot. This  
 will result in a packet that's so wide that the UPLINKED packet may be lost to  
 SAREX. We set the transmitter audio on Packet on SAREX to 2.5 kHz for  
 specifically that reason. Some of the purists (Bob, and WASNOM :-)) will  
 persist in trying to tweak in the off-channel stuff. I've seen  
 horizon-to-horizon coverage every packet pass this mission with center-tuning.

73, Gerry

Based on local traffic, during the passes over SE US, they have been on voice, not packet....might explain the problem. The robot only runs when they aren't talking.

### 332. MCC wants your SAREX APRS data

From: marchant@netcom.com (William Marchant)  
Date: Tue, 18 Jul 1995 14:56:56 -0700  
To: aprssig@tapr.org  
Message-ID: <199507182156.0AA16786@netcom18.netcom.com>  
Rendered body type: text/plain

PLEASE help Bob fill in his matrix of APRS activity for SAREX on STS-70.  
We are very curious down here in Mission Control about the success of the APRS digipeating. And negative information in the form of "I know that APRS packets didn't happen at this time" is a very important contribution to Bob's data collection. There are still about 36 hours left before SAREX gets stowed...  
Will KC6ROL

### 334. HOW TO WORK APRS-SAREX

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Tue, 18 Jul 1995 18:27:05 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950718181338.7039B-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

In my haste to get on with APRS-SAREX, I may have not given a good enough explanation of how to set up for it. Read SPACE.txt

- 1) Set ur 2m FM radio to receive 145.55 and to transmit on 144.49
- 2) Use OPS-UNPROTO to set VIA W5RRR-1
- 3) Put APRS into alt-S-MODES-SPACE so that it puts your grid swuare into your beacon and posits. If you are running 71b or 71c tell APRS how many minutes to the next pass, and it will reset your BCN and POS timers to begin transmitting your POSIT and BCN at that time. THis command toggles on/off, but a yellow box will show that you are in SPACE mode...

4) If you are at your computer during a pass, no matter what the timers are doing, you can forrce packets with the X-P or X-B commands.

Now, if you are runnning 71b, then the time-to-next pass will only work correctly for the next orbit because it adds 91 minutes to subsequent passes. That number should have been 95 miunutes (and is fixed in 71c) That is the only difference in 71c.

Rendered body type: text/plain

Hi Bob:

The problem with trying to use existing VHF packet techniques for MS and other difficult modes such as Aurora is that we're using fm. Between the waste of power and phase distortion it's a wonder that packet works at all. I suspect if we were to switch to ssb we'd be amazed at the range improvement and also how many more stations we could fit per MHz of band space. Remember if you use ssb all the output power is funnelled into the mark and space frequencies only. No other audio frequencies (well, rf, if you wanna be picky) go out into the antenna.

Also, yes, we'd also be amazed at the price of all those ssb rigs, and yes, we'd be amazed at the new varieties of cockpit error we could all make and observe.

I can't remember my information theory well enough at this instant; would the "baud" rate have to drop if we used ssb? I'm drawing a blank. If it looks useful I'd be willing to invest in a multimode rig.

### 338. APRS 6m frequency!

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Wed, 19 Jul 1995 11:46:47 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950719111634.10554A-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

With the recent excitement about 6 meter Meteor scatter potential for APRS mobile position reporting, we need to get a dedicated METEOR SCATTER freq. But we need to ALSO find a nationwide APRS tracking freq. They CANNOT be the same, since MSCAT needs to be TRANSMITTING most of the time! SO that I dont get accused of just stealing a freq, please check the band plan in your area and send the info PRIVATE back to me. I will edit and re-post this table...

| FREQ  | WASHDC                                   |
|-------|------------------------------------------|
| ----- | -----                                    |
| 50.62 | Packet                                   |
| 50.64 | avail                                    |
| 50.66 | avail                                    |
| 50.68 | avail                                    |
| 50.70 | RTTY                                     |
| 50.72 | avail                                    |
| 50.74 | avail                                    |
| 50.76 | avail                                    |
| 50.78 | TCPIP                                    |
| 50.80 | BAND EDGE for Radio Control applications |

Our area initially began operations on 50.61 and coordinated through 50.79 so that we got 10 channels. But then the ARRL band plan came out as above with 5 KHz wasted at both band edges, and we decided to accept it.

I have added these freqs to my scanner, and suspect that ALL of these channels are NOT really used. Our 6m backbone died... Maybe some of the old timer RTTY'ers did too...

### 339. APRS-SAREX score card (Wed)

#### WEDNESDAY

Only one day to go, and they sure are making a lot of voice contacts!  
We need every aprssig station on 145.55 with transmit on 144.49  
for the remainder of the mission FRIDAY MORNING. If you cannot attend your  
station, then ENLIST any other APRS station who will be home during  
passes. He can report his results to you, and you to us.

| DAY | TIME | ZONE | STATES | REPORT |
|-----|------|------|--------|--------|
|     |      |      | SEEN   |        |

|      |      |     |    |                                          |
|------|------|-----|----|------------------------------------------|
| Thur |      |     |    | Launch, no activity                      |
| Fri  |      |     |    | voice comms general QSO's reported       |
| SAT  | 0835 | EDT |    | SAREX packet heard in MD                 |
|      | 1005 | EDT | NC | *APRS posit from W4NMMK seen in MD!      |
| SUN  | 0705 | EDT |    | Open VOICE QSO's heard in MD,NC          |
|      | 0708 | EDT |    | MIR: packet BBS seen in NC               |
|      | 0720 | EDT | MD | MIR: G3ZCZ non-APRS UI gridsquare (FM19) |
|      | 0838 | EDT |    | SAREX packet! no APRS seen in MD NC      |
|      | 1013 | EDT |    | Open VOICE QSO's heard in NC,TX          |
| MON  | 0537 | EDT |    | SAREX packet! no APRS seen in MD         |
|      | 0712 | EDT |    | SAREX packet! no APRS seen in MD         |
|      | 0847 | EDT |    | nothing heard                            |
| TUES | 0540 | EDT |    | no packet detected                       |
|      | 0715 | EDT |    | Open voicec QSO's                        |
|      | 0852 | EDT |    | no packet detected                       |
|      | 1022 | EDT |    | Open voice QSO's heard in N.CA           |
|      | 1157 | EDT |    | Open voice QSO's heard in N.CA           |
| WED  | 0416 | EDT |    | no packet detected                       |
|      | 0550 | EDT |    | no packet detected                       |
|      | 0726 | EDT |    | Open voice QSO's                         |

If you observed something different or saw ANY UI frame, please EDIT  
this list and send it back. If you were up, and heard voice QSO's  
on those orbits where I indicate no packet detected, please let me  
know. (I was asleep!) But we need that data!

Version 71c fixes the 91 versus 95 minute predictions used in the  
un-attended mode...

Since some APRS users may be new to SPACE, here is how to adjust for  
doppler. (which is enough to wreck a packet near the horizon)

|               |                          |                       |
|---------------|--------------------------|-----------------------|
| APPROACHING   | TUNE RECEIVER 2 KHz high | Tune XMTR 2 KHz LOW!  |
| CLOSEST POINT | TUNE RECEIVER on freq    | Tune XMTR on freq     |
| DEPARTING     | TUNE RECEIVER 2 KHz low  | Tune XMTR 2 KHz HIGH! |

For DIRECT overhead passes, the transition is nearly instantaneous which  
means you will almost always have to account for it. For horizon passes  
it is almost a continuous straight line, so you will have a reasonable  
window in the middle when the shift can be ignored.

IF YOU CANNOT TRANSMIT SPLIT MODE, then operate ONLY ON frequency, or  
ADJUST for the correct TRANSMIT freq. All the rest of use will tell you  
if you got in! Since the doppler is opposite on transmit and receive, If  
you shift for best receive, then you are making the XMT impossible!

Good luck...

### 340. Re: [APRSSIG:2339] Re: Meteor Scatter proposal

From: BenW5SR@aol.com

To: aprssig@tapr.org  
Message-ID: <950718184615\_35548151@aol.com>  
Rendered body type: text/plain

If anyone is serious abt meteor scatter work lets set up a sched, freq, and  
mode for the upcoming persiuds in August. I may run a portable station during  
the shower from DM85 and will be mainly looking for ssb scheds on 2 and 6m  
ssb. I should be mobile APRS by then and will be happy to try anything any  
one has ideas on. If I run from the home qth I'll be running 200 watts into  
18 elements on a 29 ft boom on 2m an 50 watts into 7 el on a 30 ft boom on  
6m. Also willing to try some long haul tropo scheds. We may just want to pick

a freq on 6m and 2m for long haul aprs MS, tropo, and E-skip work. Any scheds are welcome for 6 and 2.

Kevin Heyboer sez:

>  
> Based on local traffic, during the passes over SE US, they have been on  
> voice, not packet....might explain the problem. The robot only runs when  
> they aren't talking.

Except that I've been monitoring even the early morning passes, when Don's not likely to be on voice... or when packet's woke me up... and still not seen any.

Further, WA5NOM at JSC has not monitored any over the Houston passes.

Now... in our defense, the Packet ROBOT traffic has been pretty intense. Still this is the the first time we've turned UI digi on for this kind of operation.

Bob, the good news for us is that it doesn't appear to have an adverse effect, so my recommendation will be to retain this functionality. It'd be a lot easier to justify if we could get some more activity, tho'.

With the closing of the Big Blue Cube at Onizuka AFS, I was wondering if the

USAFSpaceDef might start charging... \$1.50 per set of calculated Keps, \$5.00 if they're expected to get them right, or select the right object? Subscriptions payable in advance, of course, and they'll send you a set of Keps every time they update them for the next year, if they remember?

Temp stability is just the tip of the Iceburg. I also want one with a stout front end, a HT  
frontend is a no go for high rf installations. I have already lost one TEKK uhf 9600 radio to  
intermod deafening the radio to 4uV @ -12 db sinad.

On X1J it is easy! Set either the dxcluster or bbs ALIAS to either WIDE or RELAY, Then assign it  
a call and ssid (Here locally we use the callsign of the Gateway Station -9). With the digipeat  
function turned on the node will then beacon anything sent via the alternate ALIAS.

Rendered body type: text/plain

Has anyone tested using RELAY for the node callsign in the KAM. Does it digi?

Have we given any consideration to the QRM this might cause on HF is someone inadvertently has their unproto set to relay on HF and the KAM users digi the packets?

Message-ID: <9507191539.AA00933@seism1.ess.sunysb.edu>  
Rendered body type: text/plain

I didn't received any message for a while, could it be that there is some problems with the listserv (or with my account)? If this message is correctly distributed, can someone confirm that directly to me.

Anyway here is an update of my observations:

>From my location, Long Island, 50 miles east of New York City, 145.55 has always been dead!

Looks like I am way too north for this mission. Does anybody hear the shuttle at more than 40° north?

Bernard, KB2TGH

I believe the NASA/CNES TOPEX/Poseidon radar altimeter satellite flew a GPS  
as an experiment, and that it has been so successful that it is now used as  
the primary navigation instrument.

### 354. APRS-SAREX version 71d

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Wed, 19 Jul 1995 17:49:02 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950719170031.13329B@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

THIS VERSION IS ONLY IF YOU WANT TO TRY A BETTER UNATTENDED SAREX MODE  
TONIGHT (Wed) since Thurs morning will be the last SAREX passes this mission.  
Otherwise do NOT bother getting this version.

This temporary version uploaded as SPACE71d.zip contains the APRS71d.exe  
and a new SPACE and METEOR.txt. It is the result of Jerry Creager's obvious  
suggestion to ignore all this orbit timing stuff, and just look for any  
packet from W5RRR-1!!!

Version 71d then when placed in the SPACE mode, will just sit there doing  
its own APRS thing until it hears a packet from the callsign currently  
loaded as the digipeater in your UNPROTO string. Whenever it hears that  
callsign, it resets the BEACON and POSIT period timers to minimum and then  
also waits a random number between 0 and 20 seconds before sending the  
first packet. As usual if your packet is HEARD via the space  
DIGIpeater, then you are congratulated and your timers are MAXED out.  
Notice that on each SAREX packet heard, the timers are reset and the  
random number restarts between 0 and 20. So with SAREX packets every 3  
seconds, you only have a 3 in 20 chance of even getting a packet  
transmitted once every APRS cycle time of 5 seconds. This means, as long  
as you are seeing SAREX packets, the count-down numbers don't mean much,  
since they are constantly being reset....

To show you what is going on, the SPACE MODE display says "ARMED!" if it  
is sitting there waiting for the first packet from SAREX. Once you are  
successful, then the display returns to SPACE mode. After 10 minutes  
have passed, then the ARMED! is reset to be ready for the next pass.  
This gets rid of all that next orbit calculations based on orbital periods!

Also this version has a first attempt at METEOR SCATTER mode... See  
METEOR.txt.

Bob, will anyone be able to do a "mheard" command on W5RRR-1 to see if any of the packets made it? It doesnt appear to have made any readable data in the Chicago area.

This is something we discovered with PSK. Using sideband instead of FM, an improvement of almost 10 dB was realized...

(thanks to Tom Clark and Phil Karn for beating...er, ah... pointing this out

Page 751

I'll be headed to Oshkosh on Wednesday, 26 July, with a GPS and KPC-3 running. Departing from 4218.76N/08825.54W. I've been beaconing for digis up north of the Illinois state line for the last week - every one I have seen so far goes off the air within 36 hours, usually less than 2!

I've already talked with one of the bigwigs at ICOM, who was going to put the word in with Amateur Electronics, and MAYBE they'll leave their WIDE on 145.79 for more than an hour at a time...

(don't know if I'll be running APRS on the way up, unless I can get the HSP port to work. voltage conflicts with the laptop and TNC are a problem, too)

Hi.. i have just joined the group and am enjoying APRS..  
I have a question.. its prob. a dumb one but..  
would it be possible for the shuttle to send out APRS info so we could track it?  
or is this already being done or in the works  
thanx

You'll find that the MFJ radio has similar front-end shortcomings to the TEKK. Offsetting that are excellent 9600 baud performance and low price. Personally I wouldn't hold my breath for a unit with super front end in that price class, but it sure would be nice....

Nope. Not if you are prepared for the velocity. One merely takes the pseudorange matrix and solves for the most likely solution.

For a 28 degree mission, which this is/was, you're pretty far north but not completely out of the question. Unfortunately you get only 1-2 passes of a couple of minutes a day.

I'm working on that, Chris. I do not anticipate it to be an easy fix, off hand,because of the new hardware requirement.

On Wed, 19 Jul 1995 BenWS5R@aol.com wrote:

> If anyone is serious abt meteor scatter work lets set up a sched, freq, and  
> mode for the upcoming persiuds in August. I may run a portable station during

APR REPLY: Im working feeverishly on it! There will be a meteor SHOWER mode in the next version. It divides the country in to 4 quadrants, and APRS stations in each quadrant all transmit randomly for 2.5 seconds within their 15 second window. They will transmit very short packets (10 per xmission) of the form:

WB4APR>FM19SX:  
WB4APR>FM19SX:  
.....

My suggestion is that we do this on 145.79 (Unless someone has a better idea) and we get EVERYONE NATIONWIDE (on APRS) to participate for 24 hours. We put out the word here, and everyone then posts local bulletins on their local nets. We shut off the gateways. Hows that?

APR REPLY: He is using the symbol W which means NWS WX station. That must be triggering APRS to try to parse his packet as a WX report. I can now see that you may in fact want to use the NWS symbol without always including a WX report. I will fix this. THANKS!

|      | 1157 | EDT |    | Open voice QSO's heard in N.CA           |
| WED  | 0416 | EDT |    | no packet detected                       |
|      | 0550 | EDT |    | no packet detected                       |
|      | 0726 | EDT |    | Open voice QSO's                         |
| THUR | 0423 | EDT |    | no packet detected                       |
|      | 0600 | EDT |    | no packet detected                       |
|      | 0730 | EDT |    | no packet detected                       |

If you observed something different or saw ANY UI frame, please let me know. Also, there should be 1 or 2 additional passes per day over the west coast that we eastcoast guys could not hear. Can some one fill those in? Please do NOT edit and return this list, but send me the lines for me to insert. Thanks.

HERE ARE THE STATISTICS WE NEED to get a flavor of what was going on. There should have been about 22 passes for high latitude stations, more for southerners.

| CALL   | LAT | LON | TOTL PASS | PCKT PASS | ACTIVE PASSES | 0 PKTS | 1-5 PKTS | 5-10 PKTS | 10-20 PKTS | lots PKTS | APRS PKTS | COMMENTS |
|--------|-----|-----|-----------|-----------|---------------|--------|----------|-----------|------------|-----------|-----------|----------|
| WB4APR | 39  | 076 | 22        | 5         | 4             | 2      | 1        | 1         | .          | .         | 1         | W4NMK    |
| W3ADO  | 39  | 076 | 19        | 5         | 3             | 1      | 1        | 1         | .          | .         | 1         | W4NMK    |

TOTAL PASSES: Total for which your station was at least LISTENING  
PACKET PASSES: Total passes on which packets were DETECTED (ear is ok)  
ACTIVE PASSES: PACKET PASSES when you were ACTIVELY sending UI frames above the normal background level. Either live or by

using the APRS unattended mode to work ON SCHEDULE.  
# of PKTS DECODED: These are ONLY for those passes on which you were aware that there WERE packets (FROM THE SAREX!)  
0 PACKETS: You heard packets by ear but NONE decoded on ur TNC  
1-5 PACKETS: Total PACKETS of all types decoded FROM SAREX

Do not report obvious UPLINK packets from your neighbors who accidentally were transmitting on the DOWNlink.. Do NOT edit and return this message, unless you cut out everything but your report line... Otherwise, just send me a line with your data... THANKS!

Notice my report. Although I was listening on EVERY pass, and I had APRS properly configured for 90% of them, 2 of my goofs happened to be during the 5 actual PACKET passes! I was getting real good, tho, by Wednesday!

---

Content-Type: text/plain; charset="us-ascii"  
Date: Tue, 18 Jul 1995 14:00:53 +0000  
To: amsat-bb@AMSAT.Org  
From: ramsan@mail.internet.com.mx (Ramon Santoyo V.)  
Subject: QSO with W5RRR via W5RRR-1 as a digipeater  
X-Mailer: <PC Eudora Version 1.4>

I had an interesting QSO with W5RRR JSC Club Station this morning using W5RRR-1 as a digipeater. I have edited the LOG file for space reasons.

While connecting to the W5RRR-1 Robot I notice that W5RRR JSC was testing the digipeater.

```
W5RRR>W5RRR-1*>W5RRR [I,P;0,0]:  
digi test
```

```
W5RRR>W5RRR-1*>W5RRR [RR,P;1]
```

```
W5RRR>W5RRR-1*>W5RRR (RR,F;1)  
W5RRR>W5RRR-1*>W5RRR [I,P;1,1]:  
digipeat is on
```

```
W5RRR>W5RRR-1*>W5RRR (RR,F;2)  
W5RRR>W5RRR-1*>W5RRR [I,P;2,1]:  
digipeat is on
```

So I decide to connect with them.

```
*** CONNECTED to W5RRR via W5RRR-1
```

```
XE1KK*>W5RRR-1>W5RRR [I,P;0,0]:  
c w5rrr v w5rrr-1
```

I recived a very fast answer from JSC:

```
W5RRR>W5RRR-1*>XE1KK (RR,F;1)  
W5RRR>W5RRR-1*>XE1KK [I,P;1,0]:  
Hello from JSC
```

Then some packets were exchanged:

```
XE1KK*>W5RRR-1>W5RRR (RR,F;1)  
XE1KK*>W5RRR-1>W5RRR [I,P;1,1]:  
Hello from mexico  
XE1KK>W5RRR-1*>W5RRR (RR,F;1)  
XE1KK>W5RRR-1*>W5RRR [I,P;1,1]:  
Hello from mexico
```

```
XE1KK*>W5RRR-1>W5RRR [I,P;1,2]:  
Nice to QSO!!!!!!  
XE1KK>W5RRR-1*>W5RRR [I,P;1,2]:
```

```

Nice to QSO!!!!!!

W5RRR>W5RRR-1*>XE1KK (RR,F;3)
W5RRR>W5RRR-1*>XE1KK [I,P;3,1]:
Gil here at W5RRR

XE1KK*>W5RRR-1>W5RRR (RR,F;2)
W5RRR>W5RRR-1*>XE1KK [RR,P;3]

XE1KK*>W5RRR-1>W5RRR (RR,F;2)
Hello Gil.. here RAMON PSE QSL!
Hello Gil.. here RAMON PSE QSL!
XE1KK*>W5RRR-1>W5RRR [I,P;2,3]:
Hello Gil.. here RAMON PSE QSL!
XE1KK>W5RRR-1*>W5RRR (RR,F;2)
W5RRR>W5RRR-1*>XE1KK [RR,P;3]

By that time WA5FRF was trying to connect with Gil at JSC and my LOS was
close so I disconnect:

```

```

WA5FRF>W5RRR-1*>W5RRR [D,P]

XE1KK*>W5RRR-1>W5RRR [D,P]

W5RRR>W5RRR-1*>WA5FRF (DM,F)

W5RRR>W5RRR-1*>XE1KK [RR,P;3]

*** DISCONNECTED: W5RRR via W5RRR-1

```

```

### LOG ### DISconnected from W5RRR - Tue Jul 18 12:54:02 1995

```

It was my firts packet contact using W5RRR as a digipeater, and it was a pleasure that this QSO was with W5RRR JSC.

```

### 373. Kantronics remote SYSOP

```

From: jeff.brenton@espi.com
Date: Thu, 20 Jul 95 10:19:53 -0500
To: aprsig@tapr.org
Message-ID: <9507201019.0EII10B@espi.com>
Rendered body type: text/plain

```

I offer up the following two scripts, which are written in Crosstalk's CASL scripting language and run in Crosstalk Mk.4, Crosstalk Communicator, and Crosstalk for Windows, for logging into a Kantronics TNC that has the remote SYSOP option. These include the KPC-3, KPC-4, and KAM+, as well as possible others.

You can probably translate these to other COMM program scripting languages; the only weird item, compared to, say, Procomm, is the "slice" function. SLICE breaks a string into parts based upon delimiters (default is SPACE), and it simplified breaking the six-number strings up... The login script also choses the password string to use based upon the seconds since midnight, so you aren't likely to use the same string consistantly. This should keep your RTEXT secure.

First, a script that will initialize the RTEXT string; the text is anything you want it to be, but you should mix up case, as well as consider not using a real sentence. Just make sure you use the EXACT SAME STRING in both scripts - I use my editor's cut-and-paste feature

to make sure...

```
remtext = "This is AN Arbitrary string that iS used as the PasSword sTRing"
reply "RTEXT ";
reply remtext
```

Now that the TNC is set, this script can be run. It takes one argument, which is the call sign to be connected to. In my case, my mobile TNC is designated "WDSTK-12", so I invoke the script with "DO REMCON WDSTK-12". It also assumes you are already attached to the TNC's dialing card.

```
-- Initialize strings
remtext = "This is AN Arbitrary string that iS used as the PasSword sTRing"
remote = "C " + arg
string TNCreply, passw[3]
integer cntr,cntr1
string TNCpassw

reply remote          -- make the connection to the specified remote
label TNCloop
TNCreply = nextline    -- find out what TNC says
if instr(TNCreply,"*** CONNECTED") = 0 then goto TNCloop
-- If we get here, we're connected, and will be getting some strings
passw[0] = nextline
passw[1] = nextline
passw[2] = nextline

-- Select string to use based upon seconds since midnight
cntr = secno mod 3
passw[3] = passw[cntr]

-- Now, compute string to broadcast
strptr=1
TNCpassw=""

for cntr = 1 to 6
  cntr1 = val(slice(passw[3],cntr))
  TNCpassw = TNCpassw + mid(remtext,cntr1,1)
  strptr = instr(passw[3]," ",strptr)
next cntr

reply TNCpassw
```

As I said, these two scripts have been tested with three versions of Crosstalk in current production, so have at it!

### 374. BALLOON ALTITUDE Sensor \$9

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Thu, 20 Jul 1995 11:39:19 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950720113234.16848C-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

Carl Wick, N3MIM found a source of TINY ABSOLUTE 0-15 PSI pressure sensors about the size of a marble. They are wheatstone bridges and when connected to a small 8 pin differential chip, make an excellent LIGHTWEIGHT sensor:

SENSOR: .03% linearity, 100mv FS output, \$55 regular. Sale \$10 each  
or less in quantities of 10 or so...  
RESOURCES UNLIMITED, 603 668-2499

INSTRUMENT AMPLIFIER: INA-118 tripple instrumentation amp. Only needs one resistor to set gain. 3 for \$24.95 from BURR BROWN. Address unkonwn at this point...

### 375. MacAPRS and JNOS

From: cts@direct.ca (Fred Kehler (ve7ipb))  
Date: Thu, 20 Jul 1995 10:03:54 -0700  
To: aprssig@tapr.org  
Message-ID: <199507201657.JAA01207@linux.clrtech.com>  
Rendered body type: text/plain

Hi Keith, i am wondering, with the new versions of JNOS (tcpip/ax25 packet software) supporting 'trace sockets' allowing you to monitor all packet traffic on a particular station (any or all freqs on that station) via a telnet session. MacAPRS supports the Mac communications toolbox what are the chances of MacAPRS using the tcpip tools to monitor some jnos sockets? This would have some very intersting applications here where I have a

mountainside jnos node linked with 2MBit spread spectrum link down to a valley floor LAN.  
any comments?

Rendered body type: text/plain

Hiya!

I've been trying to make some maps of my area from the 1:100000 CDROM. I'm using MAPFIX12 to import in my .GRF files.

I can't get the "C" command in MAPFIX12 to remove the single point features. Is there a trick to this?

I'm also using DEFRAG.BAS to (drastically) reduce the number of points. On one map, tho, I'm getting a "Input past end of file" error. Any way to get around this?

Thanks for any and all help!

Rendered body type: text/plain

For those of you with the Garmin GPS-45, ver 2.41, you may have discovered if you run in Simulator mode, the unit powers down after a minute or so. I phone Garmin today and they are aware of the problem. They state they're writing ver 2.42 and it will be available near the end of August. If you feel you need the update, contact them then, and make arrangements to send your unit in then.

On a side note, there has been alot of slamming the GPS 45 due to it's 99kts speed limit. I agree if you wish to use it for aviation that's no good. However, it goes past 100 mph no problem, so for most other uses the limit shouldn't present a problem.

The family INA (INA104,101,102,110,106,117,118 ...) are very good, easy to use, almost bullet proof, instrumentation amplifiers. We used some of these in scientific strain gauges applications with success. Gain is usually adjustable 1-500 or 1000, some are very low noise, very high accuracy, other are high input impedance (FET input). The integrated circuit data book from Burr Brown contains all the informations needed to use them with examples, typical applications circuit, schematics: you just need to pick the best schematic for you purpose and wire it on a PCB, success guaranteed.

Here is the address (dated 1989, hope this is still the same):

Burr Brown Corporation  
International Airport Industrial Park

street address:  
6730 S. Tucson Blvd.  
Tucson, AZ, 85706

Rendered body type: text/plain

Bob, the Garmin GPS 45 displays its software version number on both the powerup and powerdown screens. However, both of these screens appear only for a short time, so you have to look quickly.

The powerup screen is as follows:

```
{Turning World}
Welcome to the
  GARMIN
  GPS 45
Software Ver 2.40
Copyright 1994-95
Garmin Corp
```

The powerdown screen is the same except that the line "Welcome to the" is replaced with the line "Turning off in n", where n is a three second countdown digit.

The version 2.40, shown above, is what my unit displays.

Hope this helps.

Rendered body type: text/plain

>I am looking for hams who have bought a PicoPacket from Paccomm  
>for exchange of experience. Hermann, DF2DR

I had a bad experience with a "new" PicoPacket, ordered last week.  
This is the first item I purchased from Paccom. I had intended  
acquiring "all the options" with it. While on the phone, the sales  
lady told me:

1. The second serial port option is "still under engineering  
development".
2. The extra RAM option "isn't available yet", and she indicated  
the RAM was also being held up 'by engineering'.

From the entire conversation, I had a cold feeling I wasn't going to  
acquire the desired hardware any time soon.

I had a "technically savvy" packet user work with it, and found the  
unit transmits fine, but doesn't receive data (NOT a minor problem).  
I point out this is a "new" unit, "bad" right out of the box. Perhaps  
I am drawing conclusions "on a sample group of one", but I am not  
impressed with either the bad "new" unit, or the documentation. I  
have already identified four "errata" items with the manuals, that  
aren't documented on the inclosed errata sheet, and I have hardly  
starting reading the manual.

I will be returning the unit, and cancelling my order.

I get the sense this unit is so new, I am effectively a "beta tester  
who pays for the privilege of the early debug". I do not pay for the  
"privilege" to solve someone else's electronic/software problems (I  
get paid to do that at work). Also, I do not like options formally  
advertised that are "vaporware" (or "neverware").

I will not be doing any business with Paccom until I get many, many  
good (future) "good reports" on the PicoPacket. I currently don't  
trust either their hardware, or their advertisements.

I hope this will be helpful to you, and others, sir. Perhaps someone  
on the SIG will "correct my wrong impressions about Paccom" for me.

In defense of the Pico-Packet and Paccomm

Many of us (I am very guilty of this too) have been putting a LOT of pressure on Paccomm to get this unit at ASAP. They are being pressured an extremely lot by the Balloon people who see this unit as the best thing since sliced bread.

I have about 6 to 8 Tiny 2's, several models, and have NEVER had any problems with them, I have a Handi-Packet which we currently use for balloon work, and other than the Nicad going bad, have not had any problems with it either. (it was a few years old when the nicad went bad)..

I really like my DSP-2232 from AEA, but for the 'dedicated' stuff such as APRS and tracking, I find the Tiny-2 and other Paccomm units to be the best!

Paccomm has also added many features for 'small' groups, i.e. the second serial port and extra RAM.. They should get great praise for helping the hams as much as they do.

I also need to point out, the PicoPacket listed below is  
 serial number P00022 (i.e. unit 22).

\_\_\_\_\_  
 Subject: [APRSSIG:2412] Re: PicoPacket, anyone?  
 Author: aprssig@tapr.org at INTERNET\_MAIL  
 Date: 7/21/95 11:50 AM

>I am looking for hams who have bought a PicoPacket from Paccomm  
 >for exchange of experience. Hermann, DF2DR

I had a bad experience with a "new" PicoPacket, ordered last week.  
 This is the first item I purchased from Paccomm. I had intended  
 acquiring "all the options" with it. While on the phone, the sales  
 lady told me:

1. The second serial port option is "still under engineering development".
2. The extra RAM option "isn't available yet", and she indicated the RAM was also being held up 'by engineering'.

From the entire conversation, I had a cold feeling I wasn't going to acquire the desired hardware any time soon.

I had a "technically savvy" packet user work with it, and found the unit transmits fine, but doesn't receive data (NOT a minor problem).

I point out this is a "new" unit, "bad" right out of the box. Perhaps I am drawing conclusions "on a sample group of one", but I am not impressed with either the bad "new" unit, or the documentation. I have already identified four "errata" items with the manuals, that aren't documented on the inclosed errata sheet, and I have hardly starting reading the manual.

I will be returning the unit, and cancelling my order.

I get the sense this unit is so new, I am effectively a "beta tester who pays for the priveledge of the early debug". I do not pay for the "priveledge" to solve someone else's electronic/software problems (I get paid to do that at work). Also, I do not like options formally advertised that are "vaporware" (or "neverware").

I will not be doing any business with Paccom until I get many, many good (future) "good reports" on the PicoPacket. I currently don't trust either their hardware, or their advertisements.

I hope this will be helpfull to you, and others, sir. Perhaps someone on the SIG will "correct my wrong impressions about Paccom" for me.

As one who IS testing the Pico (and paying for it: My application needed the hardware NOW) I'm quite happy with it. I've not found any problems out of the box, and it was used on the last SAREX mission between real work applications for both APRS and a real QSO.

I've admittedly not gone thru the book (yet, I need to) in detail, but typos ina new document are not hard to believe.

It actually sounds like you were given a realistic or even pessimistic view of the product when you ordered, yet you still elected to. I have to agree with Keith. PacComm's gone a long ways to support Hams in general and the APRS hardware in particular.

I can pick on a few other manufacturers, including one that's real popular here, but whose harware gave me fits a couple of years ago. I doubt I'll ever go back to them. PacComm, on the other hand, has always supported me when I've had troubles or needed something different.

73, gerry

Rendered body type: text/plain

Hello Keith,  
it looks that I was not the only one having a really bad experience with the PicoPacket. And yes, it might be that they were pressured into putting it out - put does that mean they have to advertise features which only exist in their imagination?

See, I am not posting my experiences (yet), because I hate to jump to conclusions. All I can say is that (a) my unit still does not work despite numerous hours of trouble shooting and (b) I got the big run-around from them without much real help.

Maybe it's the 'overseas' syndrome - I have not even received a manual yet.

I will switch to another manufacturer if they don't settle the situation real soon.

Best regards,  
Hermann

I think you are being a bit excessively oversensitive on the issue. They were up front with you on the delay with the options, which I understand are 3-4 weeks away. It seems clear they are undermanned for the project they are working on. You seem to expect a sleek finished project worthy of a glamorous spotlight. What ever happened to hams willing to work with equipment that is "a little rough on the edges"? Did you even give Paccomm a chance to service the item? Almost every company suffers an occaisional problem with a product, it is how they respond that makes the difference between whether I come back or not.

I personally am very excited about the prospects of using my battery powered, two serial port PicoPacket in about a month.

At least their attitude beats Kantronics, who makes a great slick little TNC but whose technical support borders very close on non-existent. (Don't get me wrong, I love my KPC-3 and KPC9612, but I have never gotten satisfaction in the many attempts at communicating with Kantronics, I have always had to rely on third party support to get questions answered.)

Subject: (U)CSE/SPD for fixed stations

Bob, a couple of locals have purchased PK-12 modems and got with it the APRS software (6.6?) I told them how to put their pos in the MAIL beacons. Works OK now (there WAS as : in the 10th place before) except I notice a course and speed marked on the fixed station. The beacon is:

YB5QZ>MAIL: comment comment !0032.10N/10127.40E- 21-Jul Messages for xxxxxxxx

APRS picks up the date and puts a CSE of "2" so a direcion line appears from the "QTH" house icon. I thought that the ! indicated a fixed station and anything could come after the \$ (in this case a "-"). I have to have DR off or the house moves rapidly :-) Do I have something setup wrong or must I tell the station not to put numbers/date immediately after the pos.? .....Keith

Chip,  
please excuse me, but do you think you can pass judgement on my motivations

the way you do?

I certainly did NOT expect a "bells and whistles" TNC - but a working, plain-vanilla one to begin with. Me and my staff (this was originally for a master's thesis being performed under my supervision) spent many hours working on this, being misled by statements Paccomm made, e.g. on the validity of loopback tests.

Chip, I have worked in research all my professional life. I hardly, if ever, deal with sleek products.

And on your remark on giving small companies a chance - I co-own one.

Best regards,  
Hermann

Message-ID: <9507212201.AA14356@sunrise.e-technik.uni-ulm.de>  
Rendered body type: text/plain

Hello folks,  
seems like I hit a nerve with my plain request for experiences on the PicoPacket TNC, and certainly with my unfortunate "leak" of a personal message to this list, for which I apologized already.

The last thing I wanted to do was start a flame war or anything resembling it.

The last email message I received from Gwyn makes me more optimistic that we can settle this issue in a civilized matter, and I hope that we can close the files on this in the same way.

Let me set a few things straight in public:

1. I had a bad experience with a certain TNC - I never questioned the quality of Paccomm's product line.
2. I did NOT expect a "sleek, all-bells-and-whistles-attached" TNC. In fact, I knew it was a new product.
3. The reason for the disagreements between Paccomm and myself were of a different nature (even though technical) and can (and hopefully will be) settled between us.

So, let us get on with more exciting business ...

Best regards from Ulm,  
Hermann

>of experience.

Hermann-

We (The Atlanta Ballonatics) are flying a Motorola Oncore GPS, A Pico Packet, and a 2 watt 440 TEKK radio on our 1200 gram balloon next Saturday, the 29th. The package has been built and tested and works well.

The TNC is such a new product, and we ("the balloon people") as well as others have pestered Paccomm a lot about bringing it to market. I have so far been impressed with the unit. It is tiny (2 ounces without case) and due to its weight (vs the KPC3), we are being allowed to fly this package along with the other experiments. The KPC3 was too heavy.

My only "gripe" is that, since the TEKK radio has no squelch, we won't be able to use receive on the balloon. Only a small price to pay, though. I understand the open squelch function (DCD option?) will be available before too long.

I will give a full report after the balloon mission.

APR REPLY: Gotcha on the : hi hi. Yes, there are a few things that APRS will parse incorrectly. and they are a \*,:,-, or \_ in the 10th position of a BEACON and also the 4th character of a POSIT comment field: You cannot have a / or a 1 there. And now you have uncovered one I didnt expect and it is the - symbol there. If that station just slips the 21 to the left one place, I think it will be fine. If you move it one space to the right, you put a 1 there, and that is the 3rd of 3 possible characters that wont work either, hi hi. Move it two places to the right and all should be fine too.

Rendered body type: text/plain

I have no experience with the PicoPacket, BUT...  
I would not use \_ANY\_ other brand of tnc for the nodes I have set up.  
I have been using the Tiny-2 and the Tiny-2 mark-2. Both are very reliable and the support from Paccomm is top notch.  
There are always infintile failures. IMHO it is not fair to condemn PacComm for this one experience. I am sure Gwyn would like to keep you as a coustomer. Talk to him.

#### 408. HELP! APRS Locks up my Machine!

From: Tom Cain <tcain@cybernetics.net>  
Date: Sat, 22 Jul 1995 11:46:45 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950722112921.21518C-100000@server1>  
Rendered body type: text/plain

Hey All-

Well, I've been lurking here for some time and fiddling around with various versions of APRS of the 6.9 and 7 vintage and the only thing I can achieve is consistency! Consistent lock ups that is!

If I run APRS and don't tell it to look for any serial ports, it runs fine. Kinda useless that way though! If I enable a serial port for anything, as soon as I attempt to move the cursor from the keyboard, the system locks up. The cursor never moves, but, I get:  
Internal Stack Overflow  
System Halted

Then, obviously, its time for the big red switch. For background, my system is a 386-40 with a 1990 AMI bios. I normally run QEMM, Speedrive, SoundBlaster, and a scsi cd-rom driver. So, first thing to try was unload all this stuff and try APRS in a totally vanilla set up. Same result. I've tried to run under windoze 3.1, same result. The only thing I haven't tried is yanking all the add-ons out of the box; really don't want to do that just to run APRS. I have included my io map at the end of this message in case somebody can see something I may have missed.

I've been hacking at this kinda of stuff for lots of years now and normally don't have any trouble making things work. APRS has me stumped though...

Anybody have any ideas??? Bob B, I'd love to register your program if I can get it to run in a reasonable manner. HELP!

Thanks & 73,  
Tom

## 411. APRS METSCAT, reflecting on a few facts

From: Ralph Wallio <WALLIO@dsml.dsmnet.com>  
Date: Sat, 22 Jul 1995 12:59:59 -0500 (CDT)  
To: aprssig@tapr.org  
Message-ID: <950722125959.5d72@dsml.dsmnet.com>  
Rendered body type: text/plain  
TO : aprssig@tapr.org  
FROM : Ralph Wallio, W0RPK wallio@dsml.dsmnet.com  
SUBJECT: APRS METSCAT, reflecting on a few facts  
DATE : 22 Jul 95

Perhaps the following will help with continuing discussions and planning for APRS METSCAT operations during the 1995 Perseids meteor shower:

### 1) 1995 Perseids schedule

The 1995 Perseids meteor shower will peak on 13 Aug at 00:44 UTC. The duration above 25% of maximum is 4.6 days, that is, 2.3 days either side of the peak. (Information from METEOR SCATTER PREDICTION PROGRAM by Michael R. Owen, W9IP/2)

### 2) Meteor shower path probabilities vary significantly and are are predictable with computer programming

The probabilities of communication via meteor shower bursts in a given direction change with time of day. These probabilities are predictable using computer programs such as cited above. As an example, during the 1995 Perseids, my path from Iowa to the northeast and southwest will peak at 16:30 UTC daily while my path to the northwest and southeast will peak at 07:30 UTC daily. These peaks are fairly broad with rates staying above 90% of peak for roughly +/- two hours.

### 3) Maximum path length

Maximum path length is achieved when radiation and reception is at 0-degrees elevation, right on the horizon. The meteor burst region is 90-110km, therefore the maximum range is 2000km (1200 miles). Draw a 1200 mile radius range circle on a map centered on your location to estimate your total METSCAT operating area.

### 4) A METSCAT path between two stations is a connection between two footprints

When a given station's radiation is reflected or re-radiated by a meteor trail, the resulting signal falls in a small area called the receive footprint. A typical footprint at longer ranges is an ellipsoid 30 by 15 miles with the longer dimension in line with the radiant path. When you receive a signal burst from a given station, your neighbor 50 miles distant probably will not, nor will anybody else outside of the footprint.

### 5) Commercial and military METSCAT station configurations using 40-50MHz

Master stations that constantly transmit probing packets typically use 500-1000W output and 5-element Yagis. Remote stations that listen for probing packets, and transmit only in response, typically use 300W output and dipoles or 2-element Yagis.

Antennas are usually installed horizontally and often tilted 15-25 degrees to optimize for a range of 250-500 miles. For ranges greater than 250 miles, transmit and receive stations are using a meteor region roughly half way between. For ranges shorter than 250 miles, the stations are using a meteor region directly overhead of the remote dipole equipped station or a region 'behind' one of the stations (backscatter mode).

The data modulation method is typically bi-phase PSK, which yields an improvement of roughly 10dB over AFSK on FM, and they use a forward error correcting protocol which is optimized for the medium.

- 6) Sporadic (random) meteor burst rates vary significantly with time of day and season of year

The highest rate is in July, the lowest in February. The highest time of day is 4:00-8:00 AM local, the lowest is 4:00-8:00 PM local. Commercial and military links run 24-hours per day, year in and year out, using sporadic meteor bursts. Meteor showers briefly and slightly increase their throughput.

APRS METSCAT operations during the 1995 Perseids should be scheduled inside the 25% of maximum window (see #1 above) and specific attempts should be chosen and scheduled for daily path maximums (see #2 above).

Schedules with specific stations should be limited to a maximum of 1200 miles (see #3 above). It may help to have another station in the same locale with which to compare notes with but remember the footprint (see #4 above).

Operations on 2m using AX.25 and AFSK on FM will significantly reduce probabilities of success. Run as much output power and antenna gain as can be mustered (see #5 above).

Finally, at this time of year when we are near the annual maximum for sporadic bursts, operations shouldn't be limited to the Perseids shower. If personal schedules limit participation during the shower, find a partner and use summer time early morning maximums. The chances of success will be almost as good as during the shower (see #6 above).

Regards, Ralph Wallio, W0RPK

## 412. Persieds METEOR shower questions

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Sat, 22 Jul 1995 15:47:41 -0400 (EDT)  
To: aprsig@tapr.org  
Message-ID: <Pine.SUN.3.91.950722145210.28928E-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

Ralph Wallio's message about the Persieds answered some questions and raised others. I was gonna respond to him directly, but thought that the more people involved in the planning, the better...

FIRST, make sure all HF>vhf GATEWAYS are shut down from 11 AUG to 15 AUG! Everyone on this list should start posting an APRS BLN in their area to be sure that everyone has the word. If anyone objects to this, let us know...

Ralph, Your recent message answered a BIG question for me, and that was the QRM issue. I have read a lot about MScat in the distant past, but yours is the first mention of the VERY PRECISE Receive circle! From this bit of information I infer these conclusions: ????

1) Dont worry about XMT QRM. As long as transmitter stations are separated by about 30 miles, no one receiver is likely to hear any two or more transmitters at any instant. Even if they are ALL transmitting 100% of the time on the same frequency! ????

2) I dont believe it, hi hi If a single transmitter is trying to communicate with a station about 1000 miles away, lets say that the beam width of his antenna is such that it would cover a 500 x 500 mile at that distance. Now if any given meteor only spot beams its energy to a 25 mile square area, then for every 400 meteors that ARE in the halfway volume of space, only 1 will give a ping at the receiver. This doesnt add up when you compare the average number of meteor events in a given volume of the sky, and the reported success rates. What am I missing?

Concerning the BIG EVENT.... you are recommending stations pair up and try to make manual one-on-one QSO's. I am leaning toward a big nationwide (hands-off) free-for-all just to count packets...

Are the two compatible?

Should the point-to-point guys pair up and go to a different freq?

The MS mode in the soon APRS72 is optimized only for the free-for-all experiment. Ralph, do you feel this is the BEST algorithm for the free-for-all attempt? Here is the logic:

- 1) everyone listens as usual

- 2) The very short MS packet is just the sending call and gridsquare  
WB4APR>FM19SX:
- 3) Each station in MS mode transmits a group of 10 of those packets  
(2.5 secs) randomly within his area's 15 second window.
- 4) The country is broken up into 4 regions, NE, SE, SW, NW and everyone  
in that region transmits in the same 15 second window (clockwise  
beginning with the NE at 00.

About the only thing I am not sure of is item 3. How often to randomly transmit so that we do not QRM each other at any given instantaneous receive site.. Right now, there is also a 50-50 chance that you will even transmit at all in your given window. This theoretically provides about an 8% overall duty cycle for any given transmitter. Or as many as 12 different transmitters can share the same TRANSMIT foot print.

I see about 50 NE stations active at any one time, so with say, half of them playing in this event, I thought these statistics were about right.

BUT IF WHAT RALPH SAYS ABOUT THE VERY SPECIFIC RECEIVE FOOTPRINT IS TRUE, then it seems that it would be safe to increase everyone's transmit duty cycle significantly. We are running out of time, and I want to release version 7.2 in plenty of time... I guess I will make the duty cycle a variable, but still it needs a default value for us appliance operators.

I will be operating the 40 foot USNA dish at 600 watts from Maryland. But it only goes down to a 10 degree elevation angle. and the beam will be 10 degrees narrow. WHO do I point it at??? Ralph, can you compute the best receive foot print range, so that we can optimize the footprint over a midwest pocket of activity?

I think I will add the 3 chars to the MS packet. The first will indicate BEAM heading and the second will indicate and gain, and the third will indicate POWER. On receive, then the symbol will PLOT a wedge proportional to heading and gain! Not only will this help those that are RECEIVING the packets, but it will help LOCAL transmitters coordinate their beam headings to different areas!

---

## 413. Meteor Shower APRS test

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Sat, 22 Jul 1995 16:21:46 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950722161058.29019A-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

Well, I used the MAPS-PLOTS-RANGE and looked out to about the 1000 mile range from Maryland and I see two areas of known APRS activity...

The midwest (IOWA, Illinois and MO)  
the Southeast (Ga, SC and FLA)

My plan is to use the 40 foot Academy dish (limited to minimum 10 degree elevation) to operate 500 watts on 2m (17 db antenna gain) for a total ERP of over 20,000 watts. But since the beamwidth is about 10 degrees, this will only cover about one state at that range... (High gain is actually a detriment to MS comms because you are narrowing the amount of SKY you can use)

Although my objective is still just to have everyone just radiating in all directions so everyone plays, if anyone is in these footprints and wants to try a two way message, let me know. I will probably operate unattended and will NOT be moving the dish frequently if at all.

Again, HIGH power is MORE important than antenna gain. Anything over a medium sized BEAM is actually a detriment.

---

## 414. CHANGE IN 71B AND C

Bob (Or anyone else!. Why in version 71b and c did the digi's turn white instead of the green like they used to be. Now don't everyone send me messages if this has already been discussed. I have been out of pocket here for a while since my whole system (Including my WX station) got hit by lightning. But the good part is there will be a new 90Mhz pentium on the doorstep Monday Hi. Also this may or may not be an upcoming bug, but yesterday after running 71c unattended for 5 or 6 hours then hitting the spacebar since i use the Screensaver, all i seen was

Bob's Famous ERROR 6 (Return to dos)

Bill KE4EER

APR REPLY: See the NEWNOTES.TXT which always explains the differences in  
each new version. Now APRS only turns WIDE-RELAY digis green. See  
DIGIS.txt

WIDE-RELAY digipeaters are those that have both a WIDE and a RELAY alias.  
This solves the delima of most mobiles as to what path to use for  
universal coverage. Mobiles can then use a path of APRS VIA RELAY,WIDE  
to be able to be seen either NEAR the digi, or NEAR a remote home station.

I turn these green, so that MOBILES can quickly see if RELAY,WIDE  
digipeating is useable in an area.

Matthew- With the new map making program and the USGS data on the Internet,  
it is pretty easy to make new maps yourself. The maps are very good. Take  
a look at GANWEST.MAP and GA-ATL.MAP and see for yourself.

Read Bob's "readme" files on making maps and then look at the USGS program  
and make a stab at it.

If you get a nice one, post it somewhere for us all. N4QEA has made some  
nice ones of Eastern Tennessee.

If you need help, I'll bet some of the mapmakers here will be glad to lend  
some advice!

Good luck

#### 420. APRS Activity in the SouthEast

From: rwf@mindspring.com (rwf)  
Date: Sat, 22 Jul 1995 23:27:32 -0400  
To: aprssig@tapr.org  
Message-ID: <199507230327.XAA22073@dylan.mindspring.com>  
Rendered body type: text/plain

I know the configuration of APRS up in Bob-Land, but no one ever talks  
about how APRS is spreading in other areas.

Everyone- tell us about the activity locally. Here's mine.

I live in Atlanta, GA Several of us have been playing APRS on various freqs

(not 5.79) for 2 years or more. One day, W7LUS, Perte who is about 80 miles NE of me saw me playing APRS on 145.07. He sent a msg suggesting I move to 5.79. There I found a digi for APRS and about 5 stations. The digi is in Jasper GA (N Central GA 50 miles S of Tennessee). It is about 2000 ft AAT. I think it is a Motorola Micor.

That was 3 months ago. Now there is a new digi North of there, in Ellijay, GA. It covers a little into N Carolina and Tennessee as well as some holes that Jasper does not cover. The digis are only 13 miles apart, but terrain splits them up pretty much. I think this is a Motorola Micor as well.

We have N4NEQ-2 in Atlanta, now. This is the first WIDE-RELAY digi in the Southeast that I know of. It covers N Metro Atlanta. Right now is only 250 ft AAT, but is moving to a different tower. It is a Ramsey Radio (NOT for long- soon to be a Motorola Mitrek)

NW GA is Dead (except for some scatter from Ellijay). But we expect a WIDE-RELAY in Dalton very soon. It will cover from the N4NEQ-2 area up through Chattanooga, TN.

NE GA is covered by W7LUS and a digi up at the EOC in Habersham County. Not sure of the actual coverage area, and I heard that Peter is working on something high.

There is a Digi in Columbus, GA, N4TKT-2. When the band opens, it talks to one in Milton, FL.

In Alabama, just across the State line, they have a digi on the highest mtn in Alabama, Mt Cheaha. It covers West GA and East AL (including Anniston and some of Birmingham, I think).

Way up in Northern Alabama, is the famous KE4EER-5. His WIDE digi is always seen here in GA when it beacons. I look forward to using it next month for the Huntsville Hamfest.

Not sure what they have in LA (Lower Alabama).

I had heard of some activity in Athens, GA on 145.07 or a similar freq. A friend ou mine, N4YCI has put the word on them about the growing 145.79 net. Yesterday, I saw WB4VNT digi in Athens beaconing on 5.79! Once he gets his alias set and the correct format in his beacon, he'll cover Eastern Georgia.

All of these Digis can hear each other, working together to form the largest APRS network I know of besides Bob's.

I will post a screen capture of our little net on my web page soon.

Well, folks- that's it. Lets see what the rest of y'all are doing!

>If I run APRS and don't tell it to look for any serial ports, it runs fine.

>Kinda useless that way though! If I enable a serial port for anything,

>as soon as I attempt to move the cursor from the keyboard, the system locks

>up. The cursor never moves, but, I get:

>Internal Stack Overflow

>System Halted

--

I personally would strip all of the cards out of the system except for

Serial card.. multi i/o card whatever

then if it works.. put the cards back in to find the offending irq or card prob

Subject: □APRSSIG:2350! Quincy Illinois Map  
 Author: HARRIS.APRSISIG at Harris  
 Date: 7/18/95 1:20 PM

Someone asked for a map of Quincy Illinois, but I cant find his message.

I extracted a 32 mile map for the area, but it needs about another hours  
 worth of work. If that person is still here, then I will continue...

## 426. APRS METSCAT, footprints and suggestions

From: Ralph Wallio <WALLIO@dsl1.dsmnet.com>  
Date: Sun, 23 Jul 1995 10:10:07 -0500 (CDT)  
To: aprssig@tapr.org  
Message-ID: <950723101007.60b0@dsl1.dsmnet.com>  
Rendered body type: text/plain

TO : aprssig@tapr.org  
FROM : Ralph Wallio, W0RPK wallio@dsl1.dsmnet.com  
SUBJECT: APRS METSCAT, footprints and suggestions  
DATE : 23 Jul 95

I could develop a bibliography of what I have in my file for folks who develop METSCAT interests with an attention time constant long enough that it would do any good. My library of articles and analysis documents is significant up to the mid-80's when my interests mutated to other areas.

The 'footprint' feature and constraint of METSCAT has been very important to both military and commercial network designers. The military folks are very concerned about probabilities of intercept and jamming. Both design camps are concerned about frequency re-use in multi-node networks and relaying requirements.

In METSCAT, 'a communication link is established only during the brief interval when a meteor trail (ionized column) occurs with the proper geometric orientation with respect to the transmitter and receiver. The proper orientation is such that the angles of incidence and reflection in the transmitter-meteor-receiver path are equal. This geometric condition, known as specular reflection, is satisfied whenever the trail is tangent to one of a family of confocal prolate spheroids having the transmitter and receiver as foci.' ... 'Certain inherent privacy features are characteristic of meteor burst communication links. Due to the specular scattering requirement, signals propagating between a specific transmitter and receiver can normally be detected by an eavesdropping receiver only if the latter is located in an elliptically bounded footprint in the vicinity of the primary receiver. By reciprocity, interfering signals (whether intentional or unintentional) from a remote transmitter will propagate to a meteor burst receiver only if the interfering transmitter is within the footprint of the desired transmitter'. (J.D. Oetting, IEEE Transactions on Communications, Vol. Com-28, No. 9, pp 1591-1601, September 1980, An Analysis of Meteor Burst Communications for Military Applications)

Dr. Oetting, then of Booz, Allen and Hamilton in Bethesda, MD, is only one of many analysts who have made this important point. METSCAT is very LPI (Low Probability of Intercept) and very resistant to jamming. He goes on, further in this paper, to make the point that the footprint is not well defined enough to yield to strict mathematical prediction. Statistical correlation methods must be used to understand and optimize the characteristic.

Other authors have further defined the characteristic in relation to underdense and overdense trails. To paraphrase Carl Sagan, daily there are 'billions and billions' of ionized meteor trails available on a 24-hour basis. Of these countless billions, the vast majority are 'underdense', which absorb and reradiate signals, and a precious few are 'overdense', which reflect signals. The footprint of the much more numerous underdense trails is known to be slightly smaller than footprints created by overdense trails. Commercial and military networks are designed to use the much more numerous underdense trails. Traditional Amateur Radio METSCAT operations (using SSB and CW weak signal techniques) have used both as the rare long time constant overdense category came to be called 'blue whizzers'.

Initial APRS METSCAT operations on 2M using AX.25, AFSK on FM and 1200BPS will only be able to use the rare overdense trails. The short time constant of underdense trails at 144MHz combined with the required time for the shortest usable AX.25 packet at 1200BPS

and required SNR of AFSK on FM preclude the use of much more numerous underdense trails.

The footprint created by either underdense or overdense trails is proportional to wavelength, that is, footprints on 6M links will be larger than footprints on 2M links. Available footprint correlation curves do not include information for frequencies as high as 144MHz, but at 92MHz the curves indicate correlation factors (footprints) which never exceed 175km along the path and 75km across the path, even at very low correlation values. The bottom line: the footprint might be fuzzy but, in relation to the link, it is very small.

So what are we going to do with this feature/limitation? (Military designers like its LPI and jam resistance. Commercial designers have to combine what are effectively point-to-point links into a network by relaying traffic point-to-point-to-point ..., ad nauseam.) For one thing, APRS METSCAT operations will not have to worry about QRM. The chance of two stations, separated by more than a few tens of miles, receiving a single APRS probe is negligible. It will be ok to go key down and transmit zillions of probes, the vast majority of them will not be coming back. (However, other local users of the same frequency who are not participating in the test may take exception.)

My recommendation for 'pairing off' was directed toward experimenters who want to continue investigation of METSCAT techniques between showers. For Bob's BIG EVENT, it could be interesting and fun to congregate on the same frequency and count what we receive. Bob's APRS concept and program have been successful so embedded APRS operations on 145.79MHz might be too numerous to allow an interfering METSCAT test of several days. Perhaps we will have to find a temporary frequency between 145.500 and 145.800MHz (the miscellaneous and experimental segment of 2M).

Traditional Amateur Radio weak signal METSCAT operations have been mostly one-on-one. VHF operators looking for new states and grid squares make schedules with specific stations during important showers devoting roughly 30 minutes per schedule. Many stations congregate on 3.818MHz, especially during early morning hours when burst counts are highest, and make impromptu additions to their master schedules. This chaos alone is fun to monitor.

We could all plan on operating on the same frequency, one APRS METSCAT test channel, 145.nnnMHz, and stations can decide to monitor the channel independently. A few transmitting stations, those with significant power and antenna gain, could use path predictions to schedule their probe transmissions (and antenna directions). Transmitting stations could use 3.818MHz to advise APRS equipped receivers of their intentions, in real time.

Transmitting stations would not necessarily need to use APRS software. TNCs could be loaded with UNProto grid square info, commanded to CONV mode, and then the return key or a simple BASIC program could control the transmit interval. At the receive end, APRS code would only need to be able to recognize and display the results of successfully receiving the minimum AX.25 format Bob has suggested.

Transmitting stations should be prepared to go key-down for several minutes at a time, transmitting thousands of APRS probes. At my station, this would mean putting blowers on the exciter and amplifier to avoid thermal shutdown.

Incidentally, while I think of it, another fact of statistical life is that while the maximum range for METSCAT links is 1200 miles, the probabilities of establishing a link fall off significantly above 800 miles. When marking maps for METSCAT range, include the 800 mile circle as well as the 1200 mile circle. The cost of efforts in the 800-1200 mile range might not be worth it.

Regards, Ralph Wallio, W0RPK

I have seen a similar problem before with keyboard lockups and serial ports.  
As best I can figure out it is related to a defect in some interrupt  
controllers built around that time. If you have a copy of any decent system  
diagnostics program (Norton works fine, MSD is useless) the interrupt  
controller should fail during tests. I've never seen a solution to the  
problem save for replacing the MB.

Rendered body type: text/plain

I think now I understand why only 1 APRS packet was digipeated by SAREX  
during this WORLD-WIDE special APRS-SAREX test. So far, only 5 stations  
have reported participating. If you were transmitting APRS UI position  
reports during ANY pass during which SAREX was in PACKET mode, let us  
know. Thanks.

Message-ID: <199507232144.QAA15930@sh1.ro.com>  
Rendered body type: text/plain

Is there anyone on the sig running a PacComm Tiny-2 MK-2 with gps, sure would  
like to have the setup since i can't get my KPC-3 to work at all even when setting  
it just like a friend of mine has his, may have to have the TNC checked. The GPS  
is working great. I also have a Handi-Packet i would like to have the setup for.  
I have seen several tracker only setups posted for the KPC-3 but all those had  
some commands left out. It would be great if those users that already have their  
system working would share the exact setup for their system for those of us that  
are getting old and don't understand the manuals like you young people do Hi Hi.  
Just remember even one wrong command will give the person trying to set his  
system up for the first time a lot of grief.

Bill KE4EER  
wnolle@ro.com  
And thanks in advance!

## 431. maps??

Message-ID: <199507240020.UAA16444@sumter.awod.com>  
Rendered body type: text/plain

Charleston's APRS community will comply with the Perseid test. We will have many stations monitoring in the Southeast corner here. WIDE should be able to get out from here with its 400 watt ERP omnidirectional signal. I'm not sure how it will work, but I have confirmed reports from something that KD4UYR in Tampa has seen our beacons first class. I was amazed. I also got a report of my WIDE being seen in Alabama, Atlanta, Virginia and Maryland. I suspected the South connections were tropo as we have huge inversions here. We work Florida repeaters with 1W HTs when it is hot. But I cannot explain the northern stations seeing WIDE direct. It makes one wonder....

I just sent a message to Tony Rath, V31L0, an old friend from my 20 meter packet days. Tony is a marine biologist that is putting Belize on packet. He is configuring a node for the country and will have it on soon. I have given him the tapr internet address and hope to get him to try 30m APRS very soon. Wouldn't it be nice to see many stations from Belize on APRS? Tony is [tony.rath@belize.com.bz](mailto:tony.rath@belize.com.bz) if you wish to send him traffic. Would someone get him on the list, please? Maybe we should hook him on this virus we all have. He'd be a great asset to APRS and a great contact!

I have been working on a little APRS page for the World Wide Web. With Bob's help, it is ready for action. Don't expect a lot yet- just an intro to APRS, a few screen shots, and a link to download the program. Bob wanted a spot to send APRS-interested folks to when they asked for info on APRS.

Currently the downloadable program is the one I distribute locally (APRS7B customized for the SouthEast), but I plan to have other single-click links to the "Official" version as well.

If any of you have any suggestions or additions, or would like to help out with this, please let me know.

Look at the screen shots. Would it be useful for me to capture shots (using a backup file provided by you) of nets in other areas for people to see? Let me know.

Tha address is below in my signature. Check out my other pages too. Lots of useful ATV info, pics, and more.

PRELIMINARY more details to follow  
(Thanks to the HABET folks in Iowa, whose format I borrowed)

Atlanta Balloon Update on 23 July 1995:

All equipment for all packages on hand.  
Payloads modules tested. Final integration underway.  
Weather looks to favor launch from Woodstock GA.

#### ATLANTA BALLOONATICS

##### Balloon #4 Mission Announcement

DATE/TIME : Saturday July 29th or Sunday July 30th  
: Release 0930EDT (1330Z) 0930EDT (1330Z)  
: Weather conditions will control exact time of release

##### RELEASE SITE:

: Antenna Test Range 7 miles West of Woodstock, GA  
: Coordinates ???

: Payload weight : 2.27kg (5-pounds)  
: Balloon : TOTEX TA-1200  
: Helium : ???  
: Ascent rate : 1000 fpm  
: Max altitude : 110,000ft  
: Max radio range: 640km (400sm)

##### FREQUENCIES AND MODES

: Packet Radio Downlink 440.1 MHz 2W  
: Retransmitted from ground into APRS net on  
145.79 MHz and on 14.105 MHz LSB  
: Standard AX.25 1200BPS AFSK FM  
: Sending APRS-compatible NMEA-183 GPS navigation data  
: No Open digipeating. No receiver. Don't try.  
  
: Altitude & Temperature telemetry on:  
146.575 MHz , 28.322 MHz , & 438.5 MHz (wide band TV  
audio)  
  
: Color ATV camera with 1 watt AM transmitter on 434.0 MHz  
  
: All antennas vertically polarized

EXPERIMENTS : More experiments in BASIC stamp control of balloon payloads.  
Stamp controlled servo/mirror for multiple  
camera views.

Possible HF net on 3.780MHz before and during mission.

For more details about this project, see the WWW address listed below

Hi Bob,

We have about 60 or so members of TAWG (Tri-State APRS Working Group) that

will be looking for your METSCAT packets too!

Here is an idea. For the METSCAT testing, why don't the GATEs move their HF port from 30 meters to 28.189 lsb @ 1200 baud and we can see how it works on 10 meters.

What do you think?

Is anybody on this list going to the New England ARRL Convention this weekend in Manchester NH?

I'm looking for another station to be sending posits at the convention site especially during my talk on APRS at 3pm on Saturday.

Also, can somebody send me (by private email) the 40 meter APRS frequency?

Thanks!

-Tom Kinahan N1CPE

I have (or will within a couple of days) a PacketMac modem hooked up to a mac Performa 6118CD (based on the Powermac 6100/60). I was wondering if anyone out there knows of a way to get on APRS with a KISS-mode TNC emulator. I know the current APRS program (I have it by the way) doesn't support KISS mode. Any information or possibilities are greatly welcomed.

Sincerely,

KISS mode will EVENTUALLY be supported in MacAPRS, however, this won't be until at least Version 2.0 and is expected to be done over the winter or next summer or even later..

The main reason for doing this is to allow DYNAMIC paths, i.e. if someone

sends a message by one path, it returns the ACK by the same but OPPOSITE path. This opens up a lot of other possibilities too..

To get this to function correctly takes a LOT of work, however, the return is worth it, but currently, there are much more important things to do. Or at least things that are important, and won't take as much time and effort..

PRELIMINARY more details to follow
(Thanks to the HABET folks in Iowa, whose format I borrowed)

Atlanta Balloon Update on 24 July 1995:

All equipment for all packages on hand.
Payloads modules tested. Final integration underway.
Weather looks to favor launch from Woodstock GA.

ATLANTA BALLOONATICS

Balloon #4 Mission Announcement

DATE/TIME : Saturday July 29th or Sunday July 30th
: Release 0930EDT (1330Z) 0930EDT (1330Z)
: Weather conditions will control exact time of release

RELEASE SITE:

: Antenna Test Range 7 miles West of Woodstock, GA
: Coordinates ??

: Payload weight : 5-pounds
: Balloon : TOTEX TA-1200
: Helium : 180 cu ft
: Ascent rate : 750 fpm
: Max altitude : 110,000ft
: Max radio range: 470sm

FREQUENCIES AND MODES

: Packet Radio Downlink 441.0 MHz 2W >>>> Note
change from 440.1
: Retransmitted from ground into APRS net on
145.79 MHz and on 14.105 MHz LSB
: Standard AX.25 1200BPS AFSK FM
: Sending APRS-compatible NMEA-183 GPS navigation data
: No Open digipeating. No receiver. Don't try.

: Altitude, Inside & Outside Temperature telemetry on:
146.575 MHz , 28.322 MHz , & 438.5 MHz (wide band TV
audio)

: ATV camera (poss color) with 1 watt AM transmitter on
434.0 MHz

: All antennas vertically polarized

EXPERIMENTS : More experiments in BASIC stamp control of balloon payloads.
Stamp controlled servo/mirror for multiple
camera views,
12 bit altimetry and 2, 8 bit temp probes.

Possible HF net on 3.780MHz before and during mission.

For more details about this project, see the WWW address:

The Radio is a modified Motorola MX-300 series handheld. The TNC is a Heath HK21, with a few minor custom mods. The last time I checked the headset was a David Clark military version, similar to the 13.4's. The antenna is a special tuned cavity radiator that is specifically designed for 2 meters and fits in either W1 or W6, the 2 triangle-shaped windows behind the Commander and Pilot, respectively, on the front of the vehicle.

The radio puts out 2.5-3 watts, and is usually operated off Orbiter 28 vDC. It has a store of standard Motorola NiCds that have been preconditioned, tested and charged before the mission. In battery mode, packet is unavailable.

The radio is set to deviate about 2.5 kHz. This is to minimize the adverse effects of doppler shift to narrowband communications receivers on the ground.

Hope this helps. I've been out of town and haven't worked my way farr enough thru the e-mail to see if an authoritative answer has already been posted.>

I'm going, and I will have my laptop and GPS with me. I won't, however, be able to help you until my PicoPacket comes (a few weeks away) because my laptop only has a single serial port. I can manually input the position from the GPS, but I won't be able to give you any real mobile data. I might not be there until after 3pm either, I am only going for the Wouff Hong (put on by my local club).

452. GPS and driving...

From: paul@paccomm.com
Date: Mon, 24 Jul 95 17:51:04 UTC
To: aprssig@tapr.org
Message-ID: <1846@paccomm.com>
Rendered body type: text/plain

Read a message from someone the other day who warned against driving and using a GPS receiver.

It is VERY dangerous to drive and look at the GPS screen. When the AIV-10 prototypes were being developed for use in Japan (no street signs) for a map navigation system, they put 100 units out on vehicles to test the ergonomics. It was supposed to be a 12 month experiment. After 4 months it was terminated because over 70 of the vehicles had been crashed by driving into lampposts, other cars, walls, etc. !!!!!!!!!!!

Please be very careful. These things are worse than HT's, mobiles and cellular 'phones all rolled into one.....

I would like to first thank everyone who responded to my plea for help in using the Garmin 45 and the KPC. Look for me tooling around South Florida...

#1

Of note, this weekend plan to test to see if the data stream continues after I exceed 99 miles an hour...Will keep you informed (look for me mobile this weekend..If I drop out then you'll know first hand !)

#2 MAPS

Can any of you guys with those CD ROMS make some better street maps of South Florida, especially Fort Lauderdale??
We would be much in your debt..

#3 Now the only problem is convincing the wife that I need another 2 meter radio and TNC for the house, while I am in the car. I am considering a cheap scanner and inhibiting the Xmit..

Again thanks for all the help.

No, it will work fine until you hit 110 MPH. Then the display blanks out. Let us all know if the data stream does the same, but since the "Track Log" also drops out during this time, I doubt that any data other than speed is even being looked at past that speed.

I hope you don't have a Vega ;)

I have had to re-subscribe to this group 4 times this year.
Any problems at your internet server and you get de-listed.
You can down load any months worth of E-Mail from the server or ask
me for a fill as I have all since APRSSIG-0000

I forgot how to test to see if one is still listed.
Re-listing yourself might tell or changing you password might give
an indication.

There are several messages a day on this group so re-subscribe ASAP.

This is the most active group I read. I have learned a lot !!!
Thanks Bob and Keith

Bob kc5ejk@onramp.net

461. STS-70 APRS-SAREX Final Report

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Mon, 24 Jul 1995 22:20:44 -0400 (EDT)
To: aprssig@tapr.org
Cc: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Message-ID: <Pine.SUN.3.91.950723212055.1207B-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

BACKGROUND

During mission STS-70, the SAREX team authorized limited testing of APRS position reporting via the SAREX digipeater. In order to have some control over the number of uplinking stations, and to have a mechanism for real-time communications among members of the experiment, the test was limited to the 150 or so stations on the INTERNET APRS SIG sponsored by TAPR. During about 22 potential orbits for most stations

in North America, SAREX was heard in voice mode on 7 and packet mode on 6. During these 6 passes, only 3 stations reported active APRS attempts and all were above 35 degrees latitude. Only 1 APRS position report that was digipeated by SAREX was observed (by two stations).

LESSONS LEARNED:

- 1) Having 150 subscribers on a LISTSERVER does not mean everyone is reading their mail or participating. Although numerous announcements were posted, I did not interrogate participants in advance for fear of reply-message overload. Post-event activity reports were obtained from only 9 individuals on the SIG.
- 2) The grid square format used for this mission can be further compressed by another 33% to as short as a CONNECT REQUEST by placing the 6 digit grid square within the AX.25 TOCALL address field. This means that the channel loading on the SAREX uplink is identical for both APRS or CONNECT request packets, except for the added digipeater field.

SUMMARY:

UI packet digipeating of minimum length grid-square position reports has great potential on future SAREX missions for a significant improvement in "success" rate for all stations, and for better visualization in the SAREX classroom. The advantages are:

- a) Successful grid square reports (26 bytes) use only 13% as much capacity on the downlink as the present SAREX replies which use 74 bytes plus 74 bytes per retry (average 2.5) plus 18 byte disconnect.
- b) Successful Grid square packets (26 bytes) use only 41% as much capacity on the uplink compared to the 18 byte connect request plus 18 bytes per ACK (average 2.5).
- c) Congestion on the uplink will be about comparable since the 18 byte connect requests are sent at about a 6 second rate compared to a maximum 10 second rate for the 26 byte gridsquare beacons.
- d) The gridsquare position report provides students with a much greater visualization of the 3D geometry of spacecraft, orbit and groundstations than a simple SAREX QSO number.
- e) Having students plot the ground stations on maps is a great learning activity for younger students.

The only tradeoff to this potential order of magnitude improvement in throughput and visual value will be the vulnerability to stations trying to use the digipeater for terrestrial CONNECTED LINKS. The usual self policing of amateur radio operators should mitigate this problem. A small change to the SAREX TNC ROM to only permit the digipeating of UI packets is a permanent solution.

RECOMMENDATIONS:

- 1) For future SAREX PACKET missions, both AMSAT and ARRL bulletins should encourage stations worldwide to uplink minimal length gridsquare position reports vice CONNECT REQUESTS. I will complete APRtrak and contribute it to the AMSAT library for tracking these posits. APRtrak is optional since school students can easily plot grid squares on maps!
- 2) Plans should be made for taking APRtrak on the both the SAREX and MIR computers so astronauts can SEE participating ground stations in range!
- 3) Plans for a new SAREX TNC rom should include the provision for enabling ONLY UI digipeating. AND for periodic insertion in the downlink of the last 80 minutes of successful gridsquare reports from the other side of the orbit. There is little penalty for this extra data, since the downlink is at least 4 times as effecient as the uplink! This WHOLE orbit data would further expand the horizons of SAREX students.

The statistics to support the above analysis comes from the following reported SAREX packet passes and the data from XE1KK showing 35 QSO numbers provided in 86 different packets over a 6 minute pass on 18 July at approximately 1250Z. THIS REPORT IS PRELIMINARY, but should include most APRS reports. A general message was also posted on the AMSAT-BB for general SAREX packet activity, but any late data from this query is not expected to change the APRS data or conclusions.

Mike, You are in luck (well sorta in luck) I am working on a set of 32 mile APRS maps for TN. Currently completed are Knoxville, Chattanooga, Kingsport/Bristol. As soon I get Nashville and Memphis completed I will upload TNmaps.zip to the sig. The zip file will include MAPLIST.TN and I will check the list file to make sure it is working before the upload. Hope that answers your question. 73 de John N4QEA @ N4QEA.#METN.TN.USA.NA

Unix uber alles! (I couldn't resist).
You can do almost anything (if you can figure out how).

Mea Culpa.

I've beens wamped since the mission doing something for my REAL job (he thinks GPS is pretty neat but...)

Bob, for the record, I'll roughly at 30.5/97. There were packets on Wed and Thurs early morning, and I'll have to go back and reconstruct.

Since I was using APRS69, I don't have good control of things like total numbers of ui, etc., and, since SOMETHING resets my TNC's MH list when I exit APRS (and I was too dull to disconnect the TNC) I couldn't capture the calls successfully when I started noting the problem.

Be that as it may, while I'm going to go back through and check all the logs and track histories, I don't recall seeing anything on-screen when I looked.

John, thanks for taking the time to make us some detailed maps. If you look above in the messages there are a 'couple maps that others have put together for the Nashville area. I've been so busy at work lately I haven't been able to load them up and try to find myself :)
Keep up the good work, and if I can help please let me know.

Yep -

They are finding the same type of problems with putting CRTs in squad cars. When we put them in Pinellas County (just west of Tampa almost EVERY deputy had a "fender bender" from hitting the car in front of them while "communicating". It is even worse now. Because of the air bags the screens are mounted lower in the vehicle (just above the "hump" and the driver's eyes are nowhere near the windshield.

I'm not sure which one is the "confab", but I've paid for the Digital Comms Conference (w/TAPR) and made travel arrangements and ..... Specifically to get some real-time interaction on APRS... SO, if this msg about the APRS Workshop is a query about the viability of delaying the Digital Comms Conference APRS Workshop... then my vote is to keep it where it is - when it is... if this request for comment is about some other event... ignore my plea to keep things the same... I guess they are. !!! Hi Hi

BTW... I saw somebody posting here that NT Rules.... KD4KSQ maybe? well, I could sure use their E-Mail address... I'm having a real pain of a time loading it on a system at home... The third floppy just hangs the system when NTFS is loading... the hard drive and floppy drive lights both stay on.... the Documentation isn't too helpful about what the problem even might be... Thanks in advance

> Ref [APRSSIG:2494]  
> P Sadowski, AH6LS, asked for help in getting NT loaded

I went through loading NT on the home system a couple of weeks ago and hit a very similar problem. The fix was quite specific to my system, however. For what it is worth, here is what happened with my system.

I have a ZERO 486 DX2 66 MHz machine with both a 5.25 inch and 3.5 inch floppy drive installed. As delivered, the 5.25 drive was "A" and the 3.5 drive was "B". That worked fine. Some time later I needed the drives swapped, (3.5="A" and 5.25="B"). Turns out that the ZEOS can do a logical swap of the drives in the CMOS SETUP program. I did this and everything worked fine for more than a year. The logically swapped "A" and "B" drives worked just as expected.

Until the weekend to install NT. At the third floppy (I think - I was installing from a CD rom, but it needed several floppies to get started), the same problem happened - the system just stopped. It had an error message to the effect that the boot floppy was not accessible. After a lot of headscratching, phone calls, discussions of the ancestry of the machine, etc. the ZEOS people suggested that maybe the logical disk swap did not work under this condition, and suggested swapping the drive cables instead. I did that, undid the logical swap in the CMOS SETUP and tried again. It all worked this time and the installation proceeded OK. (Had some troubles with the Sound Blaster drivers later, but that is another story - not completely resolved yet!).

Don't know if other machines have the capability for a logical floppy drive swap, but beware - NT does not like that. Hope this helps.

There has been a slight confusion on the APRS conferences..

The APRS workshop at the ARRL DCC In Texas has NOT CHANGED AT ALL!!!

There was a comment from WN9T about a proposed mini conference in MASSACHUSETTS that seemed to conflict with the NORTH EAST ARRL CONVENTION so he was discussing moving that.. It has NOTHING to do with the ARRL DCC conference in September in Texas..

Hope this clears everything up..

Keith Sproul, WU2Z

Paul Evans mentioned using a heads up display as a way of combating accidents from moving maps/displays. We had a human factors researcher come talk to us about that. He thought that heads up displays caused accidents by trying to mix too much stuff in the field of view. He was convinced that a lot of military aircraft accidents are caused by this. Of course the number of accidents may be less than those caused by looking down into the cockpit of

your car to read a display. If the insurance companies get excited we may see them refuse accident coverage if you were using a display at the time... (Last time I looked at the military accident statistics, most accidents happened while the aircraft was in level flight and gradually descending into terrain. The interpretation was that the pilot was distracted by in-cockpit workloads...)

The Navy has always felt that a second crewmember is necessary in aircraft to handle the workload. Take a friend along on your foxhunts! The more the merrier!

Rendered body type: text/plain

I just recieved my GPS-45 today, ordered through West Marine. Tried to order it through E&B, but they wouldn't deal with me on the coupon (tried every way I could think of to give me the coupon discount, no luck) and they also wanted over \$30 to next day air it!!!!

I am using a MAC Powerbook 165 for mobile APRS, what is the best way to connect the Garmin Power/Data cable to a Mac Connector? Do I chop up a printer cable, or mate it to a Mac to DB25 cable??....Also, what is the pinout of the Mac connector?.....

Thanks...

Ever heard of a head-up display? Think you can do this quite cheaply off the shelf now. Might be the cure for the police woes and maybe APRS if cheap enough (?). Think I saw something in Nuts and Volts a while back.

Hate to think about the Law suits, paperwork, etc. they must be getting in Pinellas!

~~~~~  
Paul,

I was talking about 1976 when we first got them in Pinellas. I would HOPE that they have learned by now.

Ozaukee County Wisconsin just now is getting in-car CRTs and so far I think we've had 6 crashes attributed to them. I am NOT a member of the Dept. here so my warnings have not been well received.

> by in-cockpit workloads...)

Another problem with heads-up displays is that your eyes have to refocus.

Maybe APRS needs a BWT mode... Brain Wave Transmission. I'm sure you can
play with the video enough to get it to send out brain waves. Of course,
the monitor might resemble your average shuttle launch...

> The Navy has always felt that a second crewmember is necessary in aircraft
> to handle the workload. Take a friend along on your foxhunts! The more the
> merrier!

If you need to do the work of two people, why not have two people? Good
logic there. :-)

Actually, if a HUD is properly adjusted, it's set for a focal length of
infinity. So that you DON'T have to refocus to see things out the window...

Instead of a HUD how about a voice synth stating speed and heading.
Also a xmit beep would be good. Seems like I am driving and am more
interested in seeing if my packets get digi'ed. Therefore, put in a extra
speaker...Listen for the audio...

#2 Re speeding > 90 MPH...Who said I was driving !!..
73 and look for me aero mobile this saturday, will see if we can
get the local gate up if anyone is interested.

I was interested but did not participate for many reasons. One of the
primary reasons on this occasion was the many long hours I am working to
get the power plant I work at back online ASAP! Perhaps the next SAREX
will approach when I have a better work schedule. I could have set it up
on one of my MANY Macs, but between the job and the tremendous heat we've
been having I've just been too lazy to do much of anything.

I am only sending this message so you can see that more than just the nine
are interested!

>the serial port RXD line to either the GPS or TNC. This allows you to
>operate APRS Mobile in SPM mode and to update your position each time you
>press the button..

Thought about it, but it has two drawbacks I can see.

1) Have to wire it for the tnc and I don't know what that will entail, so if I wire it for the switch this weekend I will have to rewire it when the tnc arrives ... that is too much work for such a little return.

2) I have had problems in the past with switches in serial ports, seems they like to loose synch (or so it seems) and not want to get back in without (a) restarting the Mac or (b) restarting the serial device or even (c) restarting both! This may have to do with hardware handshaking that I usually use ...

In reply to aprs activity in other areas, here in the Texas panhandle activity is growing rapidly. We have 6 -8 stations on with a HF/VHF gateway up at the NWS office. We are still using 145.01, but hope to have our own net up on .79 soon as activity increases. Also hope to be putting out some weather data from the NWS when we get up on there LAN. We willll have prtty much full access to there info as an ARES group. The primary purpose for APRS in the area started out for me trying to keep track of storm spotters. Any help in this usage of APRS would be helpful. 73 es gud DX Ben W55R

Rendered body type: text/plain

This version results from the SAREX experiment and the upcoming Persieds meteor shower. Salient features are:

- * Meteor Shower mode using GdSq in TO address
- * New SPACE mode using GdSq in TO address
- * Fixes extra cmd:'s in posits and Latest

For this MScat event to be successful, we need EVERYONE. It is mostly AUTOMATED, so all you have to do is set it up, and check it occasionally. EVERYONE has a chance at seeing a MS posit, and the HIGH POWER guys have a chance at being seen.

Please be sure SOMEONE in each APRS net has a continuing BRIEF bulletin announcing the NATIONWIDE Meteor Scatter Event 11-15 Aug.

489. Beeps in APRS

From: sneaker@mindspring.com (Chris Jernigan)

To: aprssig@tapr.org
Message-ID: <199507260104.VAA24974@dylan.mindspring.com>
Rendered body type: text/plain

I am trying to run APRS 24X7 in my room.. Most people leave APRS running am i correct?
I have noticed a Beeps option in the programs under ALT-s,other...
if I use this option i still hear occasional beeps thru the speaker for aprs updates..
Is there a way to make the program totally silent for running at night..
short of pulling the speaker
wire out on your PC?
OR am I missing something and don't need to run the program fulltime..
thanx

Personally I think it wasn't that great of an orbit for the greater part of
the US. I monitored the whole time and got ZERO packets in Iowa. AOS was
very short and ELV was down on the horizon damn near. Plus I think the
notice was way to short along with some of the SPACE mode problems.

Though it's a great idea and one I hope will be a regular on all
SAREX equiped flights. This is not a flame! :-) just MHO

Full instruction are in the APRS documentation in the "M" for Map section.
I have been making maps for the last week using this technique and it works
great. Any problems or question give me an E-Mail shout. I have sent a
message to the author of the 100K conversion program about looking at using
I-Net data to make those maps also.

Dave

> For Dummies like me...
> How about a Detailed HANDHOLD instruction for Meteor Scatter?

APRS SET UP FOR METEOR SHOWER 11 to 15 AUGUST.

1) Since the country is divided up into 4 quadrants at 39 LAT and 95 LONG, then point your beam toward an APRS population center in one of the other 3 quadrants that is about 500 to 1200 miles distant.
2) Run highest power
3) RUn APRS version 7.2 or later and use the ALT-S-MODES-mscaT command to set meteor mode. Choose 100% duty cycle if you can hear NO OTHER stations direct, or if you can coordinate with other locals so that your BEAM headings are not pointing to the same areas. Dont select below about 50% unless there are several of you all running comparable power and all pointing to the same area.

Thats it. Check the screen every few hours and see if you see anyDX!

In preparation, be sure that someone in your local APRS network is beaconing a BULLETIN announcing the upcoming event and be sure that any GATEways in the area will be turned off.

During the event everyone should set their paths to NONE! We dont want any digipeating!

503. Map file format question

From: jra@ag9v.ampr.org
Date: Wed, 26 Jul 1995 17:13:44 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <199507262113.RAA02474@ag9v.ampr.org>
Rendered body type: text/plain

Is "0,0" a valid data point in a map file, or is it used only to identify the beginning of a new feature?

John

504. Maps for Tennessee

From: moyers@ibm.net
Date: Wed, 26 Jul 95 23:34:48
To: aprssig@tapr.org
Message-ID: <9507270640.AA0069@slip3-219.fl.us.ibm.net>
Rendered body type: text/plain

APR; Bob, I have uploaded the file TNMAPS1.ZIP to the APRSSIG upload area here on tapr. The file contains Maplist.TN, TNmidet.MAP, TNneast.map, TNseast.map, TNnmid.map. The zip does not have path info in it, so when you unzip the file copy the files to their correct paths. Was going to wait til I had the MEMPHIS area done, but due to several requests for the file and time constraints on this end decided to send it now.

505. Re: [APRSSIG:2437] Persieds METEOR shower questions

From: sdimse@umed.med.miami.edu (Steven S. Dimse)
Date: Wed, 26 Jul 95 23:41:43 EDT
To: aprssig@tapr.org
Message-ID: <9507270341.AA22880@umed.med.miami.edu>
Rendered body type: text/plain

Bob, a couple of questions...

Since I'm running MacAPRS, I'd like a few details about what the meteor scatter setting in APRS actually accomplishes, so that I can duplicate it as closely as possible.

For the grid square message, is the format just '[EL94gp]'? Will that display OK on the PC version, and does the capitalizxation matter?

Count me in for this experiment, I'll have two stations operating, one a 13B3 pointing towards the NE (my FL Keys QTH) and the other an 8db ground plane (from Miami) both running 170 watts.

506. Help Compaq Aero/APRS

From: DDOBBINS@aol.com
Date: Thu, 27 Jul 1995 01:28:17 -0400
To: aprssig@tapr.org
Message-ID: <950727012816_41733366@aol.com>
Rendered body type: text/plain

Pls respond back to me "ddobbins@aol.com" and not the SIG. Thanks.
I just purchased a Compaq Contura Aero 4/33C, added another 4MB ram and spent four hours loading it from older B&W laptop. Alas, color portable APRS/GPS mobile, or so I thought. Having a problem getting APRS to boot. Here's what happens: I'm starting APRS from a DOS menu (DA 5.1), the map comes up and note "initializing TNC", then the laptop locks up. I have to power off to reboot. Didn't do this w/other laptop, only on the Contura. Figuring perhaps a serial port config problem, I checked it out and it appears OK. When I use Pacterm or PaKet, the cable/port/TNC all work normal. Only APRS doesn't work. Here's the other quirk: APRS is squeezed on the top and bottom of the screen, about 1" on both top/bottom. Sides are OK. That's it. Comments or suggestions pls. Otherwise I'm gonna pack up the Contura and take it back.... Too bad, I got it at a great price, less than \$1k. Dave, WH6YC.

507. STS-70 packet Heard list (fwd)

From: Gerald J Creager <gerry@cs.tamu.edu>
Date: Thu, 27 Jul 1995 07:51:03 -0500 (CDT)
To: aprssig@tapr.org
Message-ID: <199507271251.HAA29937@solar.cs.tamu.edu>
Rendered body type: text/plain

As advertised, here's the QRZ list from the STS-70 TNC and computer database. Obviously, this is not a comprehensive listing, When the TNC is not connected to the computer, ie., completely autonomous, we can easily lose some stations in the list. Anyone see anything familiar?

73, gerry

508. Compaq Aero prob FIXED!!

From: DDOBBINS@aol.com
 Date: Thu, 27 Jul 1995 11:26:15 -0400
 To: aprssig@tapr.org
 Message-ID: <950727112613_41982437@aol.com>
 Rendered body type: text/plain

That didn't take long. Thanks to those who responded with ideas. I called Compaq and spoke with a smart techrep who directed me to a file to dl from their FTP.COMPAQ.COM site. I don't remember which folder I found it in, there were several, but the file is called SP0743.ZIP. After the dl and unzip, I had a file called COMFIFO and upon running COMFIFO 1 OFF from the DOS prompt, then executing APRS, my problem with the lockup disappeared and once again I'm a happy camper. The tech rep said the Compaq serial port is "different", and uses the 16550 UART, which may not be compatible with external devices like a TNC when invoked with some DOS programs, like APRS. OK - I'm over my head. All I know is that it works. You can also dl the file from Compaq's BBS at 713-378-1418.

I was quite please w/the price of my Compaq Aero 4/33C. I had longed for a color laptop, and didn't think I'd find a new one for \$950, but that's what I paid at COSTCO. Has 4MB ram, 170MB HD, and includes an external floppy disk that plugs into the PCMCIA type II cardslot. I added another 4MB RAM for \$240 from Office Depot. That may have not been the best price, but it was just across the street.

Anybody want to buy my B&W Zeos subnotebook? Great condition, has 4MB ram, 80MB hard disk (to 160 doublespaced), includes ext. floppy, ac adapter/charger and DC adapter. DOS/Windows 3.11/APRS 72a/Lotus Organizer/Works/Uninstaller and a bunch of other files. Paid \$1500 1 1/2 years ago. Sell for ??? Make me an offer. Dave, WH6YC and Aloha Y'all (Texas Hawaiian) from on assignment in Bremerton, WA.

ANSWER: It is a separator. NO POINT CAN HAVE AN X value of 0.
But Y can be 0.

510. LORAN with APRS

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Thu, 27 Jul 1995 11:54:51 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950727115126.21752H-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

Well, I finally found out why the Academy sailboats using APRS were not showing course and speed, but everyone here on the SIG says it works fine. Turns out APRS had one line of code looking for \$GPVTG instead of the generic \$xxVTG, so it only worked with GPS! This will be fixed in future releases. If you are currently using LORAN and need this fix now, lemme know...

511. Re: [APRSSIG:2535] LORAN with APRS

From: bottmgun@emi.net (Jay K. Jeffries)
Date: Thu, 27 Jul 1995 13:05:53 -0400

Bob,
Some of our Civil Air Patrol units are equipped with LORAN for ground and marine ops. We are still coming up on APRS so it isn't a great rush. Thanks again for an excellent job done.
Respectfully,
Jay K. Jeffries

512. Meteor EVENT Announcements

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Thu, 27 Jul 1995 13:24:15 -0400 (EDT)
To: aprssig@tapr.org
Cc: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Message-ID: <Pine.SUN.3.91.950727115455.21752I@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

In order to get the word out, we need people on this SIG to post the following METEOR SCATTER ANNOUNCEMENT on their local and regional BBS's and on any other INTERNET SIGS that may have interested people. I will post it on AMSAT-BB. Notice that it is NOT just an APRS test, but any one with a TNC can play: CUT HERE and POST ELSEWHERE...

-----CUT HERE-----
NATIONWIDE 2 METER METEOR SHOWER TEST 11-15 AUGUST

The August QST Packet Perspective column by Stan Horzempa pondered a plan to test 2 meteor scatter. LETS DO IT! Amateurs Nationwide are hereby encouraged to participate in the Persieds Meteor Shower which will peak on 13 Aug. Although 6 meters is far better than 2 meters for meteor scatter work, everyone has a 2 meter radio and we can make up in numbers what is lacking in performance. All you need is a TNC, and preferably high power and a beam. The objective is to see how many grid square (DX) packets you receive over the 4 day event.

Here is the plan: Stations in the four quadrants of the country will alternately transmit for 15 seconds. Stations will transmit the shortest possible meaningful packet formed by placing their 6 digit gridsquare in the UNPROTO TO callsign field. eg, W3ADO>FM18SX: The suggested frequency is the ARRL experimental packet frequency of 145.79. BE SURE THIS FREQUENCY IS NOT OTHERWISE ASSIGNED IN YOUR AREA. EVEN so, you can still monitor!

STEP-BY-STEP SET UP PROCEDURES:

- 1) Point your beam towards a major population area about 500 to 1000 miles away in one of the three other USA quadrants. If there is another 2m local station, coordinate your beam headings so that you are not both hitting the same azimuth and receiver target area.
- 2) Enter your grid square into your TNC using the following command:
cmd: UNPROTO FM18SX
(If you cannot estimate the last 2 digits, use AA)
Notice that there is NO VIA DIGIPEATER used!
- 3) ATTENDED OPERATION: Enter the converse mode (cmd: CONV) and then each time you hit your carriage return key, you will send a packet. Hit 20 CR's and you will send a bundle of 20 grid square packets.

Synchronize your clock with WWV and transmit as many CR's you can in the following schedule:
North East stations transmit between 00 to 14 seconds
South East ... 15 to 29 seconds
South West ... 30 to 44 seconds
North West ... 45 to 59 seconds

- 4) UNATTENDED OPERATION: This will probably be the most successful:
a) Set your BEACON TEXT to ^HP where H and P are single characters:
H is beam heading divided by 10 and expressed by the digits 0 to 9 and then A through Z. 9=90, A=100, B=110, C=120... Z=350
P is the square root of your power %10. 1=10, 2=40, 3=90... 9=810
b) Set your BEACON to EVERY 1. This is not in accordance with the scheduled 15 second cycle, but it is better than nothing if you are operating un-attended.
- 5) Alternatively, run the APRS program version 71b or later, which has an automated mode for Meteor Scatter and will plot all received packets on the map. Also, in many areas, 145.79 is already being used for APRS. Read the APRS METEOR.txt file.

EXPECTATIONS: Meteor scatter paths are VERY specific between the transmitter and the receiver, typically any single event will only be heard by receivers within about a 20 mile footprint. This is why everyone can transmit at the same time in the same area, preferably pointing their beams in slightly different directions. As long as there is about 50 miles between identical TRANSMITTING stations, their signals will NOT probably hit the same receivers at the same times.

W0RPK and K1HTV did make a successful 2 meter packet contact in 1984 over about a 1000 mile path, but it took 2.5 hours of constant packets. Hopefully by having hundreds of transmitters, and hundreds of receivers, we can improve the statistics. The best time for meteors is in the early mornings from 0400 to 0800 LOCAL time. But it is not much worse the rest of the day...

REPORTS: Since you will possibly see packets that no one else will see, send all gridsquare reports (Only those known to be greater than 250 miles distant) to me and I will compile the data. Be SURE to include your gridsquare!

Bob Bruninga, WB4APR @ KA3RFE.MD or
bruninga@greatlakes.nadn.navy.mil (preferred)

P.S. The Naval Academy 40 foot dish (Annapolis MD) will beam towards Florida on the 11th, Atlanta on the 12th, the midwest on the 13th. Donno about the final 2 days yet. Expected ranges are only about 550 miles, though, because the elevation cannot get down below 10 degrees. The range to Atlanta and Indianapolis are about perfect for that...

Most likely what you are experiencing is the slow drift that Selective Availability induces when dynamic loads are low. IF you're moving more rapidly both horizontally and vertically, I suspect you'll see better accuracy and precision.

Also, I've not proven this theoretically or with rigorous math yet, but I suspect that the L1-C/A code solutions close to the geoid are more prone to error than those above the ellipsoid. In other words, it's worse closer to the ground than in the sky. This thought is based on observations flying, driving, and with L1/L2 survey equipment, and resolving the ambiguities there.

518. Running Dos APRS on floppy

From: RonN9QGS@aol.com
Date: Thu, 27 Jul 1995 22:47:16 -0400
To: APRSSIG@tapr.org
Message-ID: <950727224715_42442558@aol.com>
Rendered body type: text/plain

Bob or anyone who can answer this, I am looking for the necessary files to run APRS, I just downloaded 7.2a and I am going balloon chasing, and only have a 720k portable, what files must be on the disk, besides command.com to boot the disk, probably 650K disk space available, some of which will be a map or 2.... Appreciated.
Ron

519. Atlanta GA Balloon Launch 7/29/95

From: rwf@mindspring.com (rwf)
Date: Fri, 28 Jul 1995 00:33:19 -0400

ATLANTA BALLOONATICS

Atlanta Balloon Update on 28 July 1995:

All equipment for all packages on hand.
Payloads modules tested. Final integration underway.

DATE/TIME : Saturday July 29th or Sunday July 30th
: Release 0930EDT (1330Z) 0930EDT (1330Z)
: Weather conditions will control exact time of release

*** Launch site now appears to be favoring Dallas GA.

RELEASE SITE:

** : Dallas, GA 30 miles NW of Atlanta, GA
: Coordinates ??

: Payload weight : 5-pounds
: Balloon : TOTEX TA-1200
: Helium : 180 cu ft
: Ascent rate : 750 fpm
: Max altitude : 110,000ft
: Max radio range: 470sm

FREQUENCIES AND MODES

: Packet Radio Downlink 441.0 MHz 2W
: Retransmitted from ground into APRS net on
145.79 MHz and on 14.105 MHz LSB
: Standard AX.25 1200BPS AFSK FM
: Sending APRS-compatible NMEA-183 GPS navigation data
: No Open digipeating. No receiver. Don't try.

: Altitude, Inside & Outside Temperature telemetry on:
146.575 MHz , 28.322 MHz , & 438.5 MHz (wide band TV
audio)

**** : Charts for decoding of C.W. telemetry may be found on World
Wide Web at address <http://www.mindspring.com/~rwf>

*** : ATV camera (B&W) with 1 watt AM transmitter on 434.0 MHz
: All antennas vertically polarized

EXPERIMENTS : More experiments in BASIC stamp control of balloon payloads.
Stamp controlled servo/mirror for multiple
camera views,
12 bit altimetry and 2, 8 bit temp probes.

Possible HF net on 3.780MHz before and during mission. Still do not have a
Net Control. Anyone wanna come do it?

For more details about this project, see the WWW address:

Date: Fri, 28 Jul 1995 08:37:12 -0400
To: aprssig@tapr.org
Message-ID: <199507281237.IAA09901@dylan.mindspring.com>
Rendered body type: text/plain

>For those interested in tracking the balloon Saturday morning, I have posted some charts on my Web page. The charts will allow you to convert the CW telemetry being transmitted on 28.322 MHz into Inside and Outside Temperatures and Altitude. Of Course, the GPS data will be sent out into APRS-land.

If you want the charts, they are on the page: <http://www.mindspring.com/~rwf>
Just select the "Atlanta Balloonatics" page from the menu.

If you are using Netscape, you can download the gif files by holding down the SHIFT button while clicking on the filename on the page.

Here's a question-

This is a 2-4 hour mission, taking place at 13:30 Z Saturday the 29th.
Will there be any problem with sending the GPS telemetry out through the GATE? Do y'all wanna see it?

I attempted to digi thru SAREX on 3 mornings, with no success. I blamed the failure on my omni directional antenna & bad timing (voice passes). Since I was not geared up for space communications, I was not surprised by my lack of results. I AM surprised that everyone else seems to have had such poor results.

Considering my experience with LEO satellites and omni antennas, I more suspect that it's the nature of the SAREX antenna on the vehicle that contributed to this.

For the record, the SAREX antenna used on the last mission was the usual one, not something in the payload bay. It's a tuned cavity resonator, and its tuning is pretty critical. It is interference-fit into one of the triangle-shaped windows in the forward flight deck (W1 or W6) which are the aft-most forward flight deck windows (and, yes, I know this is a confusing description...). These 2 windows are beside and slightly behind the Commander and pilot, the 2 guys who get good seats on launch and landing...

The pattern of the antenna, for you antenna gurus out there is an annulus with a half-cone angle of approximately 85 degrees, with an exclusion half-cone of between 5 and 10 degrees. All of these numbers are theoretical. We never got a chance to place to 1:10 mockup back in the anechoic chamber with a 1:10 antenna in a window, and our Enterprise tests at Dulles Airport were done in a hangar with too many reflections to allow us to determine patterns.

So, to put it charitably, it's a dynamite high-tech antenna widget, but as antennas go, sometimes it's not even a good dummy load (especially if it's mistuned!). Don't despair too much if you were unsuccessful. Sometimes it's hard!

APR REQUIRED FILES:

- 1) you must have all sub directories even if empty
 - 2) You should take most of the APRS\SYSTEM files
 - 3) You must have MAPLIST.USA and any local MAPLIST.xxx
 - 4) YOu should have USA.map plus any others you want
- That should do it...

...

I've had very good luck with SAREX over the last few years, using my OSCAR equipment, a KLM 22CX on an AZ/EL rotor and 170 watts, I often work them on the first call. Sadly, I was stuck in Miami during this entire mission. I was surprised to see my call on the heard list, despite running a ground plane and 45 watts. However I never heard my call come back down, and apparently neither did any of the APRS listeners.

I don't find it too surprising this experiment was a bust, given the QRM that a SAREX flight generates, the simple packet equipment most APRS stations were using, and the limitations of the SAREX payload. I think

trying to set up a few days of tests on MIR would be much more productive.

As far as I know 30 m only
There is a rumor of a 14 Mhz GATE going up in Athans, GA. If it does- I
guess itll be on both.

Hope you saw- it is delayed until Sat Aug 5th due to weather

Heck, between a lot of knowledgeable people picking up on how the program works, and WB4APR adding more complicated bells and whistles onto the program, it ain't hard to start falling behind some of you computer literate whipper snappers.

For those of you coming to the Huntsville Alabama Hamfest i have a new very detailed map of the Downtown area where the VBCC center is located. This detailed map was made from the 1:100,000-scale CD-Rom, by the way my first attempt hi. This in addition with our Madison county map would make it easy for thos using GPS to get you to the Hamfest site. I have placed this map in MAPLIST.USA so the set will include this also. The only problem i have is how do i get this to you?. Anyway just tough someone maybe interested. By the way the Downtown area map is 36K....

Bob, i have been trying my hand at mapmaking, and did well with the Downtown huntsville 1:100,000 scale map using the CD. The is a big problem tough with what i believe you call the negative lines. the map is full of the (I'm talking maybe 30 or so). Now some of these don't show when actually using the map in APRS (But some do). The last editing session when i zoomed in on where all those points meet it gave the old Error message as follows:
Fture# 274 4416-25- 21
MapPt# 1341 Val:210 782
Error Beyond Repair = 6 Hit Enter to Return to DOS.

This is with the Makemap14.exe version, but have noticed this with other versions also. I noticed there is a command to get rid of the negative lines i assume but it doesn't do anything. Sure would be great if this problem could be solved somehow hi...

Did you try slow flight? I don't know what you were flying but it's
certainly no big deal in most aircraft to crank them back to less
than 80 knots...or is the limit lower?

Are those the lines that always end up from the edges to point 0,0?
Those are "one point" lines, and the best way is to use a word processor
to hunt them out and delete them.

They look like:

0,0
7, 23 - 898
896,375
0,0

To be a "true" line, it would need a second set of points after the
896,375. As it is now, the program assumes that 0,0 is the second point, and
"ties" it into the next line. After a while you get good at hunting those
little ghost lines out.

Well, I have heard of a few people that always leave their Dead Reckoning off, because they say it messes up their screens. I always say, that if you are getting dead reckoning errors then your clock is off, and you should fix your clock and date rather than turning off DR.

Well today, an AERO mobile flew over our net running a stand alone tracker outputting RAW \$GPRMC sentences... I was getting DR errors and looked at the raw data... and discovered something.

The TIME field in the RMC was in LOCAL time!

APRS always assumes the time is ZULU because that is what the NMEA standard says it should be. Apparently this GPS (I think it was a GARMIN) was in local time, and LOCAL TIME IS TRANSMITTED IN THE RMC DATA!

In my opinion, this is a violation of the NMEA standard (ill look it up tomorrow) and is a problem for that GPS manufacturer to fix. SO, if you have your GPS in local time, be sure it is outputting ZULU time in its data sentences!....

I havent studied the GPS commands, maybe the owner of this GPS forgot to tell it the time zone offset, and it thinks it is doing correctly.... Anyway, maybe this explains why some people insist that they get DR errors even when THEIR clock is OK. All stand-alone-tracker owners must be sure to set up their GPS to output in ZULU time.

It's no surprise that the 45 gets stupid in an aircraft. It's a marine GPS and isn't interested in aircraft whatsoever. I frequently fly my GPS-75 in a 206-B3 and it winks out at around 104 mph. The good news is that it IS tracking the constallation and all ya gotta do to get the display back is slow down.

I've watched the 'Skyview' window while in a commerical jet and it seems to still seems to be tracking, it just can't process the data. Well, I guess that's the tradeoff between \$400 & the \$1100.00 Aircraft version.

AHA! now I see what that is.

Now how about this:

When do the 100K maps I always seem to get lines that run around the edge of the map. Sometimes they appear to be connected to real roads, and sometimes they are just there by themselves.

Is this related to single point lines?

Anybody else noticed that the HABET balloon tracks won't load.... gives an error.
Load into an editor and delete the first line.....

Then it'll work.....

Think they are taking the track history and then editing it, but in the proces they do something that APRS F-L doesn't like!

In playing with the Trimble SV-6 core module and the Motorola VP OnCore core receiver, I've found that both have a mode command that allows you to tell the receiver what service it's gonna be used in, and therefore, which strategy to use to acquire satellites on the fly and to deal with acceleration and delta-V. I truly doubt Garmin's got different engines for the marine and

aviation versions of their venerable handhelds... I suspect some of the computing horsepower they have in there is dedicated to marketing (and maybe to the lawyers) and that their lockout is intentional. I'd love to tell you for sure, but I can't get a straight answer out of the Tech Support folks. They wouldn't even sell me a tech manual on the GPS 55 AVD, 'cause I might open it (already had...) and then try to fly! Sorry, but since I spend so much time with the hardware already, that's pretty lame!

Rendered body type: text/plain

I had posted a request for everyone to check with their frequency coordinators to find a permanent 6 meter Meteor scatter (and separate APRS) frequency. So far NO ONE has responded. All I am asking for is a copy of YOUR EXISTING PLANS so that we can select minimum grief frequencies. Here is the current band plan in the Greater Wash DC and Baltimore areas....

In the absence of any contravening data, for this AUGUST 11 to 15 test, lets use 50.62 MHz for any APRS 6 meter METEOR SCATTER TESTS..

50.62 packet backbone (defunct) & I have crystals
50.64 avail
50.66 avail
50.68 avail
50.70 rtty freq (probably defunct)
50.72 avail
50.74 avail
50.76 avail
50.78 avail
50.80 bottom edge of radio control band

I suggest the LOWEST and FURTHREST From the radio controllers for 6 meteor METEOR SCATTER WORK. This means 50.62.

Then i suggest 50.78 for APRS...

547. APRS Meteor versions

Rendered body type: text/plain

I have already encountered my first desired addition to the Metoer Scatter mode for the upcoming test. It is a DIGI-FILTER for MS work. With it, ALL PACKETS heard OTHER than DIRECT are ignored... This will keep your map and lists clear of everytthing except for packets heard DIRECT... I will be releasing this in a day or so. SO if you are planning on doing the MS test, you can hold off donwloading until 72b is posted....

It's a distant cousin to the single point line. When a map is created by using the usgs import, a set boundry is made, Those Horz/Vert lines are segments of roads/stream/etc that would love to cross the boundry but can't due to international law, or something like that.

Before mapfix14, it drove me crazy figuring out which point/line to kill to get rid of those pesky monsters. With the "highlite" feature of "F"ind, I move may cursor to either the start or end of the line, Hit "F" to see if its the right line I want killed, then kill it.

Unfortunately 1 in 100 of those lines are real features, so check it out against a "real" map before deleating it.

My brother is leaving Cedar Rapids, IA 8-2-95 to Winterpark, CO and will be running a Garmin45 direct to a PacCom tiny2 TNC2. Now for the questions!

What vhf to hf gates are along the way?

What freq's along the way?

What's the best way to setup the digipath?

The route is:

DEPART Cedar Rapids (IA) on the US151	½ mile	W	Amana
Turn left onto I380	21 miles	S	North Liberty
Turn off onto I80	97 miles	W	Ames
At Altoona, IA, stay on I80	15 miles	W	Urbandale
At Urbandale, IA, turn off onto I35	5 miles	S	Clive
At West Des Moines, IA, turn off onto I80	95 miles	W	De Soto
Stay on I80	102 miles	W	Council Bluffs
Stay on I80	106 miles	W	York
Stay on I80	115 miles	W	North Platte
Stay on I80	55 miles	W	Ogallala
Turn off onto I76	63 miles	W	Sterling
Stay on I76	118 miles	W	Fort Morgan
At Commerce City, CO, stay on I76	9 miles	W	
Turn off onto I70	3 miles	W	Vail
Turn off onto SR58	6 miles	W	Golden
Turn left onto US6	11 miles	W	

Bear right onto I70 4 miles W Vail
Stay on I70 10 miles W Vail
Turn off onto US40 16 miles NW Steamboat Springs
ARRIVE Winter Park (CO)

This is just for kick's but if anyone has any thought's drop me some
mail at barrettd@crpl.cedar-rapids.lib.ia.us.
If anyone get's an HSTS file on NM0B-4 which is the APRS ID for a bike (no
motorcycle symbol) We'd love to have you
e-mail it to us. Thanks

Barrett (^-^)

I sent aa6vn@bdt.com a note on how to get subscribed directly; hopefully, he'll receive it!

3. MFJ-8621 data radios

From: jeff.brenton@espi.com
Date: Mon, 31 Jul 95 22:34:46 -0500
To: aprssig@tapr.org
Message-ID: <9507312234.0VPXH0Z@espi.com>
Rendered body type: text/plain

The MFJ's finally arrived, two days after my "drop dead" date for getting them installed before I left for OSHKOSH for the weekend. Even this required begging and pleading with MFJ directly, and they still didn't send all three radios order - just the two for our EOC.

Opened the boxes Sunday, and found that - despite delaying my order for over two months, MFJ did NOT install the crystals, as ordered, but merely sent them along for me to install. This saved me \$2 (discounted price on crystals through R&L Electronics), but I put up with the delay (they'd had radios on 145.01 in stock at R&L when I ordered) because they were supposed to arrive ready to go...

Still haven't put them on the air; too many things going on as part of the aftermath of 2.5 days vacation time, plus planning a trip for one of my employees. So, an on-air report is still a week or so away for me. But, I figured I'd keep everyone informed!

... I hadn't seen this.

However, for the long term (not this latest shower), have we decided on the
modulation and mode of choice?

Possible choices:

Modem Modulation (Type of radio)
1200 AFSK (FM)
1200 PSK (SSB)
1200 PSK (FM)
4800 FSK/MSK (FM)

4800 PSM (SSB)
9600 FSK/MSK (FM) *
19,200 FSK (FM)

* My personal choice.

As far as a 6m freq and mode I think we also need a national 6m and 2m ssb APRS freq. It would be interesting to try e-skip, FAI, and tropo via packet. I will use 145.79 as I see band openings for unattended ops (if the bands open and I'm home APRS takes a back seat. Would like to see a freq at the low end of both 6 and 2 m for ssb APRS and general packet operations. Would like it at the low end because long boom antennas 3+ wavelenghts have narrow bandwidths. Maybe just above the beacon subband, this could evolve into a new type of beacon for vhf ops. Any other thoughts on this from other VHF+ operators or any one in general? 73 Ben W5SR DM95cf

13. 1995 Perseids 6M Packet Radio METSCAT Test

From: Ralph Wallio <WALLIO@dsm1.dsmnet.com>
Date: Wed, 2 Aug 1995 15:21:08 -0500 (CDT)
To: aprssig@tapr.org, vhf@w6yx.stanford.edu
Message-ID: <950802152108.3c6@dsm1.dsmnet.com>
Rendered body type: text/plain

1995 Perseids 6M APRS Packet Radio METSCAT TEST
Ralph Wallio, W0RPK and Carl Richey, KB0QQQ

W0RPK will transmit APRS compatible packet radio beacons on 50.620MHz during the 1995 Perseids meteor shower. Automatic transmissions will occur during the first half of each minute using standard AFSK on FM modulation. During the second half of each minute W0RPK will monitor for packets from other stations. The test will start at 0001UTC 11Aug and end at 2359UTC 14 Aug (Thursday evening to Monday evening CDT).

Transmissions from W0RPK will include grid locator EN31FK in the UNProto field and a date/time stamp and packet serial number in the text field, e.g., W0RPK>EN31FK:12 12:34 123456. APRS version 7.1b or later will be required to plot received packets.

W0RPK station operations will be automatic and attended during the entire test. A transmit controller will initiate 100 packets during the first half of each minute. A receive controller will

display, log and plot any packets received during the second half of each minute. Automatic station operations will be interrupted for formal or impromptu skeds. See contact information below.

Stations participating in the test will need to be within 1200 miles of central Iowa and equipped for 6M FM packet radio operations. Station operators are encouraged to forward copies of all received packets for test analysis. Test participation certificates will be awarded. QSL cards will be available for complete 2-way QSOs.

The following chart predicts 1995 Perseids meteor scatter path peaks from W0RPK. Plan participation accordingly.

Path effectivity : * = >50% ! = >75%

Since I have not made a lot of progress on the APRS chip, there is an alternative, though not quite as ideal as the original idea. If anyone has a voice network and wants to try this, then please do, and report the results here... This is for the PACCOMM TINY-2 or any other GPS-TNC with an RF carrier detect input on radio-TNC connector. Here is the idea:

- 1) Simply tie the voice radio PTT line to the carrier detect input of your TNC. (Pin 5 on the TNC)
- 2) Combine the TNC transmit audio with the MIC audio

With the above, the TNC should never transmit any packets until you have released the PTT. The problem is that it can still key up the radio when you are receiving... Here is an untested idea to solve that problem

too..

This voltage doubler turns on the transistor whenever there is audio present on the voice receiver. This keeps the 500 uF capacitor charged and therefore keeps the CARRIER DETECT pin low, thus preventing the TNC from transmitting. The long time constant of the 500 uF and 22K resistor should prevent packets for a few seconds since the last audio. When you hold your PTT, there is no audio in the speaker, so this circuit relaxes. When you release the PTT, the pin5 snaps high, and the packet goes out! To minimize the irritation level on the repeater or voice channel, users should reduce the deviation of their packet audio to less than voice levels... The only disadvantages to this circuit are:

0) The speaker may have to be relatively loud to get enough audio to activate the transistor...

1) the packet is longer than my compressed APRS packet and will take about 1 second vice .25 seconds...

2) Someone needs to see what happens to the buffered position packets! Do they just QUEUE UP, and ALL COME OUT AT ONCE when the audio channel goes quiet or when your PTT releases, or Does only 1 come out???

If only the last POSITION packet is transmitted when the channel or PTT clears, then this IS A VIABLE APPROACH FOR ADDING POSITION REPORTING TO VOICE RADIOS AND NETWORKS...

My thoughts is to go with what WD4APR had proposed since it follows the recognized band plan more. I work a lot of 6m and I know there are a bunch of beacons on the bottom end between 50.0 and 50.1 MHz. A lot of the dx beacons are located outside of the FCC designated beacon sub bands. The area between 50.080 and 50.100 is used by several cw operators including dx. These signals tend to be quite weak with marginal band openings yet can produce some spectacular dx. I'm afraid aprs packet beaconing in this area could disrupt cw dx contacts. A case in point is the sporadic e conditions to Europe that was experienced this summer. With the multi hop conditions needed to have propagation to the midwest, the signals from Europe ended up being VERY weak. I managed to make 1 contact with a station in Spain. However the single hop stations on the east coast were 40 over S9! It's tough enough to work the dx without having an unexpected packet covering up the station you are trying to work. Lets keep the bottom end clean of wide band digital signals. Thanks, Jay....

Well, whenever there's a new mode or technique, there's always someone that
is interfered with or displaced, real or imagined. There's the AM->SSB
story, and the ever evolving digital world of
RTTY->AMTOR->PACKET->CLOVER->PACTOR->GTOR->PACTOR II....

On the other hand, I don't want to see what has happened to the 20M beacons
happen on 6M (I was one of the privlidgeed few to visit 9L1US in operation
from West Africa). However, I think (or perhaps the phrase "HOPE TO GOD"
would be a better choice) that the 6M modulation of choice will NOT be slow,
noisy, 1200 baud AFSK. Hopefully, it will be short bursts of 9600 baud
FSK/GMSK data. This is not likely to be a major source of QRM when a single
station is heard, but definitely a problem with several stations come
through during an opening when some poor OP is trying to ID a CW beacon.

Someone else can carry the "A beacon is a beacon" line, but....

I don't think that there's a compelling need to keep this in the low end of
the band. Granted, most beams are resonant there, but I don't really see
many of the dyed-in-the-wool 6M operators out there (the ones that are
currently active on voice) are going to jump into this digital MS stuff. I
believe that most of the experimenters in this mode will come from the
digital ranks, and build 6M MS stations from the ground up.

It's not a great problem to tune 6M beams for other sections of the band,
and with people like M2 out there, you basically can tell them the
frequency, and it's done. There's not a lot of 10+ element 6M beams out
there, and besides, no one in MS wants a narrow beamwidth antenna anyway.
Heck, some operators (like myself) won't even install a rotor on the beam.

So, after this shower, I hope that there will be some general consensus so
that we don't interfere with all of the other interests (*) in the lightly
loaded 6M band. Any operation this month should NOT be construed as the
"new home" of MS beacons until we have a chance to work this out on a
regional or nationwide basis...

All:

I am the repeater frequency coordinator for Wisconsin.

As a matter of fact we are having a WAR (Wisconsin Association of Repeaters) meeting in September. I will bring it up.

There is also going to be a MASSIVE meeting in October, being referred to as the BOM (Big October Meeting) among the coordinators on OUR remailer. I'll _try_ to get a spot on that agenda also.

Why don't you describe, in detail, what you want.

NO promises - I'll see what, if anything, I can do.

Message-ID: <v01520d02ac44c08b4ddb@[199.1.11.136]>
Rendered body type: text/plain

Here are some notes on getting old archived SIG mail. I think with a little fixing up these can be added to our APRSSIG FAQ.

We need this information because it is very easy to get DE-LISTED from this group and miss mail.

We should also assign a few people to keep a complete archive of old aprssig mail and act as fillers for people who are missing a small number of mail items. I am willing to be one.

```
===== Archived Mail FAQ =====
The server archives mail by month. The archived messages do not have
APRSSIG numbers in the subject. I don't know how to get a smaller set of
messages
from the list server.
```

First send a Mail message to:

```
listproc@tapr.org
Subject : Any thing you want (I make it the same as the one line body message)
Body of message : INDEX APRSSIG -ALL
-----
```

You will get something like this back:

```
Archive: aprssig -- Files:
dec.94 (1 part, 55587 bytes) -- MacAPRS 1.1.0 Update
jan.95 (1 part, 258357 bytes) -- RIGHTIME v2.58a
feb.95 (1 part, 136014 bytes) -- Re: [APRSSIG:129] Re:
mar.95 (1 part, 487473 bytes) -- request a step by step map procedure, please.
apr.95 (1 part, 697439 bytes) -- Need APRS .INI file
may.95 (1 part, 1032541 bytes) -- Mail Archive for aprssig
jun.95 (1 part, 763893 bytes) -- Velocity in APRS to convert 2MPH
jul.95 (1 part, 484328 bytes) -- subscribe
-----
```

Now send a message to get the files or mail archive you want.

```
Send a Mail message to:
listproc@tapr.org
Subject : any thing you want (I make it the same as the one line body message)
Body of message : get aprssig jul.95
-----
```

You will get something like this back:

```
Archive APRSSIG, file jul.95.
Part 1/1 (subpart 1/8), total size 484328 bytes:
.....
(...hundreds of lines of mail)
-----
```

The archive will be sent in chunks but be ready for about 0.5 Megs per month. The format is a pain to read as it has the complete mail header and the subject line doesn't have the APRSSIG reference number. If you know how to parse it let me know.

=====

One final note:

The first message sent to a new subscriber has as the last line:

"To unsubscribe from this mailing list send a message to `listserv@tapr.org` with the following line in the body of the message:"

signoff aprssig

I would have to agree, the if we are going to use FM packet for the meteor scatter test, then we should move higher up the band. In the area of 51MHz would be fine, and most of use with low band antennas should still have an antenna match less then 2:1.

I will also be on from FN03.

25. Superspeed APRS

From: lbutler@awod.com (Larry Butler)
Date: Wed, 2 Aug 1995 09:01:18 -0400
To: aprssig@tapr.org
Message-ID: <199508021301.JAA21218@sumter.awod.com>
Rendered body type: text/plain

I keep seeing a lot of talk about some superspeed APRS on 6 meters and other bands. These senders are looking to keep the packet length down to some short burst. This sounds good but they are failing to, in their quest for 115,200 baud, take into account some other very important factors. As speed increases, timing becomes more and more of a problem in relation to reflections (like TV ghosts) and multipath from the ionosphere. Low speed data is, because each mark/space is long, very tolerant of these reflections. This is the reason why Pactor and other modes SLOWS DOWN when conditions are bad. At 9600 baud, the superspeeds (in comparison to the time delay of a multipath signal) become critical. Yes, the data is faster, more compact, but even the tiniest amount of impulse noise is taken by the decoding program as a part of the data. The tnc's timing algorithm cannot distinguish between the data and these tiny noises. And, when a reflection arrives a few microseconds late, it confuses the program because the high speed modem decodes this late-arriving data as more bits. To illustrate this, make a 1200 baud connection to your favorite phone BBS. Start downloading

something and watch your terminal's speedometer. Pick up the phone and make some noise. 1200 baud ignores you, happily running its slow timing algorithm and transferring the data...like a snail. Low and Slow. Now call the bbs back at 28.8kbaud. If you pick up the phone, chances are the superspeed modem will IMMEDIATELY bomb completely and hang up.

Now we come back to radio. You are trying to hear a noisy, multipath packet from some DX station. The noisier the better. Let's all go to 28.8kbaud. It just won't work. If FCC let us use 28.8kbaud on 20 meters nothing would get through. If you are one of the 6meter stations, I am not because of Channel 2, I want you to try some dx at 110 baud. You can't type any faster anyway. If you are using a KAM, hook the Hf modem output to your 6 meter rig. Then reset TBAUD to some lower values. The KAM will do any baud rate on HF from 50 to 300 baud. We have tried some experiments on 20 meter packet under awful conditions using 50 baud packet. IT WORKED GREAT! I could copy some friends in Nova Scotia when the Smeter didn't move for hours! What is too bad is that the packet specs don't make some automatic speed DECREASE when packet fails and sits there retry and retries after retries until it bombs. That's one thing that Pactor and Gtor do very well.

All this fantasy with 9600 baud just won't do under weak signal, noisy conditions. A new wide spectrum modem will be needed that has a broad band multicarrier system like your 14.4k or 28.8k modems. This might be the answer.

Good Luck...Larry KN4IM lbutler@awod.com

SURE. If you are using their data cable, just run external power in to the wire marked external power. If you invented your own cable, then limit the input votage to 6 volts! Thier cable has a 6 volt regulator in the little black bbump in the cable...

The data cable for the Meridian includes a little box with a voltage regulator that will accept external power and feed it to the Meridian. The unit I bought at Hamvention (not an XL) included the data cable; I don't know if the same deal applies to the XL.

Still learning about my GPS-45 that I received last week....

This has happened twice in the past four days:

The unit had been on for about 8-10 hours (running on DC power cord with no data output being used) when all of a sudden the data on the bearings screen went "blank" and the unit started beeping, the message it gave me was "turn off power and reinitt the unit" Ido not remembe reading anything about this in the SIG before... My unit has the software revision of 2.42.

If it keeps this up, I don't think it will work very well for standalone

tracking.

I have the Garmin GPS-45 and love it!. It and a KPC-3 (along with a transmitter) make up my mobile "tracking" station. I have a comment and a question.

Comment to Bob B.:

When the unit is in 2D navigation, the low speed accuracy appears to be +/- about 10 MPH however when in 3D navigation the accuracy at low speeds appears to be within 0.3 mph. This may be important for your low speed filter you discussed previously. The 2D nav mode is used when it does not track enough birds accurately for 3D navigation. I get this mode about 2-5% of the time because I have the stub antenna at dash level in the car and have not put up a rooftop antenna.

Question to all w/ GPS-45:

If the speed limit is 99.9 kts, and one exceeds this speed, does the data stream reflect "V" with no lat/long or is the data output still "A" accurate? Your comments would be appreciated.

The first time I saw this, I called Garmin. Seems the USAF had been diddling the satellites. They called it maintenance.

I've noticed this several times lately (I usually have 3 or so GPS's up all the time now) and I suspect they've been twiddling bits up there again. It does not appear to be a problem with your set.

One thing I've NOT done is checl NOTAMS for info on tests and protocols, nor checked the GPS inof BBS's for those data. I may try later.

HI,

A week ago, or so, someone posted his GPS settings for his KPC3. I thought that I had saved that message away in a safe place so I could find it again (oh well you know how that goes). Now that I am getting ready to use my KPC-9612, with ver 6.0 software, for GPS I would like to see that info again to help get things setup.

So, could someone please forward that message along again?

I think it's a good idea but I would like to recommend that each position also hold an alternate so that if the designated individual goes away on vacation or can't reply immediately (for whatever reason), they can either plan ahead for the alternate to fill in, or after a slight delay with no response from the primary the alternate can step in.

I don't know about others, but with rare exception I check my email at least TWICE every day and sometimes more than a dozen. The only exceptions to this are when (a) I got to VT/NH to spend time with my parents/in-laws or (b) when I go away on vacation (like soon to FL for six days).

Comments on Meteor Scatter vs HF (re: Larry Butler)

When a meteor ionizes strongly, the signals reflected come in at a good strong level, not the 'weak signal' referred to.

Since the ionized patch is small, there is very little multi-path.

Higher speeds will work just fine.

What one would hear is silence followed by a strong clear signal as a meteor ignites, with the signal gradually falling in intensity as the ionized trail dissipates. Gradually meaning a few seconds or maybe ten seconds.

The ideal protocol for moving data would be full duplex. The station with data to send (one of the stations if both have queued data) continuously blasts out a short frame over and over to the other. (this frame contains data header info such as file name, or frame number if in the middle of a file, etc.

As soon as the other station copies the frame, it acknowledges (full duplex remember) and hammers out the ACK. As soon as the data sending station hears the ack, it begins to dump sequential frames at max rate. It does not wait for acks, but will accept fill requests (usually filled on the next meteor). While the sending station does not wait for acks, it does accept and log them. When it stops hearing acks, it can assume the path is lost and returns to hammering out the 'opening frame.' Now it is clear what should be in the 'opening frame,' the oldest NAKed frame followed (after the path opens again) by the remaining NAKed frames and then some new ones.

It also looks like the 'receiving station' should include the highest frame number received and a list of fills needed in its ACK or NAK message.

Of course if we had this selective reject protocol with modulo 128 or 256 frame numbering we could do a lot to improve backbone links and satellite links....

But back to the basic point - ms provides an intermittent path, but not a bad path.

38. Meteor Scatter APRS cautions

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Wed, 2 Aug 1995 17:52:40 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950802155251.16923A-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

Consider the following notes when operating APRS for packet MScat:

- * Only versions 71c and later will decode GRID SQUARES in the TO field
- * Since a GdSq packet is treated as a POSIT, it will only show up on the P-LIST, D-LIST, HEARD log, and MAP. It will NOT show up on the A-list nor on the L-LIST (after the first one).
- * Packets with the MScat format (^HP) will be plotted with their beam headings on the map and the power is indicated in the P-list comments.
- * Alt-B can be used to replace the (^HP) format with any BText
- * Any other BText will appear at the receiving station in the P-list.
- * ALL versions of APRS must see at least 3 characters in the BText or the packet is ignored. That's one reason for the 3 char MS report (^HP).

***** THIS MEANS THAT APRS WILL NOT SEE NULL PACKETS: WB4APR>FM19DX:

You will NOT see someone using only a bare TNC with the grid square in the UNPROTO path and hitting dozens of ENTER keys to make lots of packets. They must put at least 3 chars in their BTexts and set BEACON to every 1.

Its too late to fix this for this event! Everyone that is using APRS will

see all other APRS MS stations, so I doubt we will miss anything. No one is actually going to sit at their TNC for 4 days straight and hit the ENTER key anyway...

Here is a chronological list of versions relative to MS mode only:

72b Added DIRECT filter so you can filter out all VIA DIGI packets
72a no record of MS changes
72 Added MS Send in the TO field INCLUDING POWER and HEADING.
71c Introduced MS mode with GridSq receive in TO field. Select alt-S-MODES-mscaT. (or CONTROLS-FILTERS-GDSQ, I forget which)

RECOMMENDATION: Use version 72b if possible. Try it first with a friend!
If you are sending TNC packets only, be sure to include at least 3 characters in the packet.

Hi there APRS mapmakers, i would think by now there would have been someone with some programming skill that also makes maps write a little program that would delete or at least mark those pesky single line points. All it would take that it would pick out anything that has less then 3 lines between the 0,0 points in the file (All valid points have at least 3 lines) between the 0,0 Now you notice i said ALL IT WOULD TAKE, not being a programmer i don't know if this would be a small or big job Hi Hi. I find that removing (Editing) out the single point lines is a bigger job then actually building the map from the 1:100,000 CD Rom. By the way i have made 8 maps of the Huntsville Alabama area with great detail, specially the downtown area map. Bob i think doing it this way still beats digitizing!.

Correction N4NEQ for RWF.

```
> ???           Magellan GPS
```

Bob, now for my question, who is the expert on the Magellan's? I just acquired a Trailblazer XL which does claim to output NMEA in selections 0183A, 0183B, 0183C. The output for NMEA 018B is RMC and RMB. Will this unit work? By the Way Bob I guess I now need to send you a request for the GPS registration, never really thought I would use/need it....grin.

Also the unit is a Differential gps and claims to measure speeds upto 900 MPH, This I WILL NOT BE TESSTING. I will confess to testing it to 80 MPH and it does quite well with 5 birds in view. So if It works with APRS, I am well satisfied at its 299.95 sticker price.

I thought about that too. I am not sure there would be tremendous benefit to it though. Part of the idea of the list is to share information. The biggest reason to have those email addresses would be to email them instead of asking common questions on the list, but if you know enough to know that you probably have been around long enough to know the answer. In other words I don't think it will actually accomplish too much.

On the other hand, I would like to have their addresses just in case I have a highly specific question that I don't want to bother the list with. Hopefully they will be smart enough to publicly post responses to common questions they have seen in private email.

Perhaps you are right-let's find out.
My name is Dave Kaplan. I have been in CAP for 21 years. I am currently living in SIoux City, IA and am with Nebraska Wing. I have been working with AZ wing CAP who is using APRS extensively. I am doing my first "real" demo at a practice SAR this weekend and will demonstrating APRS to the NE Wing on the 26. I have learned how to make 1:2,000,000 maps from the internet and now have the ability to make a map of anywhere in NE,MN,IA,SD,KS or MO in under 10 minutes from the downloaded files on my laptop. This will work perfectly when you don't know where you are going to be based for a REDCAP (Actual Search). If I get sent to a different location I can download the raw data from the internet in about 10 minutes to make the maps. I have been in contact with the author of the program to convert 1:100,000 to APRS trying to see about using the 1:100,000 files on the internet rather than having to buy the CD ROM. Am still waiting for answers from him.

I will be attending CAP National Boards in Washington, D.C. in two weeks and am wondering if any other CAP members that are part of this SIG would like to get together and compare notes. I am rooming with Mike Marrek, the NDRN (National Digital Radio Network) coordinator so I will have plenty of time to "bend his ear" about APRS.

SUBJECT: Problems with replaying downloaded APRS .HST files
DATE : 03 Aug 95

Paul,

I note that you are having problems replaying APRS HABETnn.HST files downloaded from ftp.tapr.org. I rechecked the path and have discovered an interesting quirk. You are correct, data in the original APRS generated .HST files has been significantly modified. Modified files have been checked for APRS replay compatibility before upload. The quirk has to do with the downloading process.

My test of downloading HABETnn.HST files finds problems when the FTP link is set for BINARY rather than ASCII. When .HST files are downloaded using BINARY, I receive only <LF>s at the end of each line instead of <CR>s and <LF>s. APRS appears to need the <CR>s because replaying files without them causes APRS to blow up. When .HST files are downloaded using ASCII, I receive <CR>s and <LF>s. APRS replays the files with no problem.

Bob, WB4APR, may not be able to program around the problem in future releases. The fix appears to be for us to set our FTP links to ASCII before transferring .HST files.

53. Hello

Message-ID: <9508031559.AA37433@lineng.ipc.amex-trs.com>
Rendered body type: text/plain

Hello all APRS'ers,

I'm new here so let me intro myself:
Jerry Wyatt 1st Lt CAP Arizona Wing (APRS Tech)
N7QVU @ KC7Y.AZ
jwyatt@amex-trs.com
w) 602-492-2545

I agreed to assist with CAP questions mostly regarding APRS and what we are doing with the system. I can also answer basic questions about CAP, but have only been a member for 1 1/2 years.

I got involved with APRS 2-3 years ago, and have been testing all aspects of it. I also had a lot to do with the latest wave of TNCs that support GPS. I beta tested PACCOMM, TAPR, and Kantronics TNCs before they were released.

Last year AZ Wing of CAP(Civil Air Patrol) was given the task of testing the possibility of using APRS for our mission. It has been tested for Ground Teams and also in the airplanes. Nine planes and several ground teams are running a remote APRS system...GPS w/TNC. It allows the mission coordinator and others to know the locations of all(nine) planes during a mission. The project happened about the same time that CAP installed ARNAV Star 5000 GPS in ALL planes. So therefore we/CAP are gaining a lot of experience with GPS, prior we were using Loran to assist in searching and identifying location on the ground.

I also have the USGS cd-roms and have created many maps for AZ, for hams and CAP use. I also run a LLBBS that has about 200 users that most locally pull the latest version of APRS from. I have many out-of-state callers also. The LLBBS # is 602-938-7528. I supporting APRS in AZ, I have given many lectures/programs to the ham and CAP community. We also did a real-time demo at CAP National Convention last August.

Hope this info is enuf to let you know where I'm coming from!

> Since you have incorporated the ability to transmit on two freqs via the
> KAM (and others), I suggest that when you type "S" to send a
message, you be allowed to append the To station with /H or /V.

APR REPLY: There is a way to do this already. Operate the KAM as a GATEway only. Then on the 2 meter side, routing via HF or VHF is simply a matter of the UNPROTO path. Operate a second APRS station on 2 meters and use the SEND xxxxxx/YY command to select a YY path that has GATE in it.

This is what I do from my home on 2m via the HF gate at my office.

Clearly this is not the best solution for the KAM owner, but it is usable by everyone else. My hesitation at adding the STREAM switches into the code, is the added modules, and thehassle of keeping track of what stream you are on...

>map. Bob i think doing it this way still beats digitizing!.

I'm working on a program that does this, among other things. It's at least a couple of weeks away from being ready, and the code is ugly, but it may be useful to some folks.

It will work as follows, using the .dat file produced by makemap or usgsmapi (it does its own point trimming, so you don't need the "every Xth point" routine that those programs apply to the .dat file when they create the .map file):

1. Delete adjacent duplicate points -- large scale maps from USGS are full of 'em, probably from the rounding process. This alone can reduce the number of points by a large percentage.
2. Delete single-point features.
3. Delete the third point of a three-point feature if it's the same as the first point (ie, the feature is a straight line that doubles back).
4. (I'm still working on this part) Delete "tiny features" where "tiny" is defined by some total line length, or total enclosed area, parameter.
5. Finally, trim every Xth point, with X selected by the user.

The goal of this program is to make it easier to make large scale maps (my project is a set of maps showing the Great Lakes shoreline). I've started with .dat files of over 20,000 points and wrestled them down to the point where they're small enough to get into mapfix to do final manual editing, with the end result a map of maybe 2500 points showing the entire Lake Superior shoreline.

When this is finished, I'll upload it to APR and let him decide whether to include it in a distro.

CIBA high-altitude balloon launch is scheduled for Saturday, August 5, 1995. Launch time for the helium filled 1200 gram balloon is set for approximately 9:00am CDT from Washington, IL. Estimated maximum altitude, 85,000 feet.

Recovery operations will use Metamora repeater 147.255+, and Toluca repeater 146.895-, DF car to car frequency will be 146.415 mHz. There may be other repeaters to the East used if needed.. A special event station is planned to operate an hour before launch until touchdown using call N9MSG on 7.235 mHz.

Rendered body type: text/plain

1995 Perseids 6M APRS Packet Radio METSCAT Test
Ralph Wallio, W0RPK and Carl Richey, KB0QQQ

Test Information Part-II

W0RPK will transmit APRS compatible packet radio beacons on 50.620MHz during the 1995 Perseids meteor shower. Automatic transmissions will occur during the first half of each minute using standard AFSK on FM modulation. During the second half of each minute W0RPK will monitor for packets from other stations. The test will start at 0001UTC 11Aug and end at 2359UTC 14 Aug (Thursday evening to Monday evening CDT).

Packet transmissions will use standard 1200BPS AFSK on FM as typically used in local packet radio networks. Beam headings will be controlled by 2-way QSO attempts, by requests for specific beacon paths and to take advantage of predicted path peaks.

Claiming a complete METSCAT QSO requires both stations to receive and display a minimum of one packet containing both calls, one packet containing a signal report and one packet containing a signal report acknowledgment. I suggest the following protocol for 2-way packet radio METSCAT QSO attempts:

- 1) Both stations transmit multiple packets (100+) for 30-second intervals with the opposite call in the UNProto field. (W0RPK will transmit in the first half of each minute.)

W0RPK>WB4APR: (no text) 00-30 seconds

WB4APR>W0RPK: (no text) 30-60 seconds

- 2) When either station displays one or more packets containing both calls, that station will add a short signal report in their text field. Reports will be 'Snn' with nn being the total number of packets received.

W0RPK>WB4APR: (no text) 00-30 seconds

WB4APR>W0RPK:S10 30-60 seconds

- 3) When either station displays one or more packets containing their signal report, that station will add 'R' in their text field indicating receipt of their signal report.

W0RPK>WB4APR:S3 00-30 seconds

WB4APR>W0RPK:S25R 30-60 seconds

- 4) When either station displays one or more packets containing acknowledgment of their signal report, they will add 73 in their text field indicating receipt of the acknowledgment.

W0RPK>WB4APR:S27R 00-30 seconds

WB4APR>W0RPK:S65R73 30-60 seconds

- 5) Both stations must display calls, signal reports and acknowledgments before the QSO is complete.

W0RPK>WB4APR:S32R73 00-30 seconds

WB4APR>W0RPK:S72R73 30-60 seconds

Each station should transmit as many UI packets as possible in it's assigned 30-second interval. W0RPK will be using a transmit controller running a simple program to save wear on the <ENTER> key (and operators).

Rendered body type: text/plain

Helpful hint # 2 (until the mod mapfix15 come out).
I do one 15' section at a time, at one layer (road level 3, Streams, etc)
and work on it till i get the points down, then go with the next level.
This way, I am dealing with a smaller number of points to play with. Once
I have all the levels done, then I import them into one map, and go on to
the next 15' section. If you try to do all the levels at once, you will over
load your self with single point lines.

Helpful hint #3 - Use 4500 as your Points per degree, with
the map center in the center of the 15' quad you are working on. 4500 with
over lap the 15' box a little, and if you are centered, you will not get
the single point lines (a lot of the periminter lines, but they are easier

to handle) - I always make a "overlay/starter" map of the area that I want to map, and divide it into 15' segments with white lines, and use it to import the USGS info into. This way you have a good idea what area your USGS data covers, and if your PPD box is big/small enough.

(I can normally crank out a 15' section with level 1 thru 6 roads, major streams & WB's in a 3 to 4 hour sitting, and have it come in at around 2,000 points.)

I am about ready to begin testing of my widget for putting your stand-alone-tracker packets onto the tail end of your voice transmissions. I need some GOOD beta testers. Here are the requirements:

- 1) You must have a GPS and stand-alone-tracker
- 2) You must be a hanko and VIP in your repeater organization. ie, you must be able to make a lot of noise on your repeater (packets) without someone turning off the repeater on you!
- 3) You must have frequent access to the repeater to install a TNC and a extra packet transceiver, and extra visits for troubleshooting and tweaking
- 4) You must be willing and able to install my small circuit board inside your TNC and find all the appropriate attachment points.
- 5) You must fully understand AX.25
- 6) You must be willing and able to tinker with the repeater controller and packet TNC to optimize the interface between them.

If you are interested, lemme know!

"Drop dead dates only work if you enforce them"...

True, Dave, but I'd figured two months was PLENTY of time for MFJ to
deliver something they SAID was "in stock, ready for shipment"...

NOTE OF WARNING: Several people at R&L told me that you can NEVER
count on MFJ to ship ANYTHING on time. If it is in stock at the dealer,
that's the only "guaranteed" shipment. Larry at R&L told me that an

over-\$10K order they had with MFJ (which included my radios) was trickling in, \$100 to \$300 worth of equipment at a time...

With regard to an earlier thread on whether or not we'd be willing to pay a \$10 or so premium to get radios already crystaled up for APRS, if MFJ's performance with a \$25 premium is any indication, we do NOT want to think about the delivery schedules a \$10 premium would entail!

I'm not quite sure how this has leaked over into the APRSSIG, but the "National Digital Radio Network" is a Civil Air Patrol term for our rather large national network backbone.

It consists of about 25 Clover equiped BBS running AA4RE. This BBS link into the various VHF networks that the CAP has around the country. In fact, the CAP's Clover network is the largest Clover net in the world.

ATLANTA BALLOONATICS

Balloon #4 Mission Update as of Aug 4, 1995 at 12:00Z

As you probably know, last Saturday's balloon experiment was postponed due to weather. It was rescheduled to Saturday August 5th.

Lots of bad weather is still passing through this area due to Hurricane Erin. Many damaging thunderstorms occurred throughout last night.

A preliminary go/no go decision will be made this afternoon, around lunch time. I'll try to get the word out here as quickly as possible.

Bill Brown, WB8ELK, is almost a "local" now, living in Huntsville AL and has told us he will be attending this launch.

If you do not have EMAIL access at home, you can get an update from our info line at (404) 936-3737. The info on there at the moment is very stale, and I probably will not update it until after 17:00Z. today.

Message-ID: <302212B4@msmail.cho.ge.com>
Rendered body type: text/plain

Yes! I'm interested. Down here in C'Ville we help with a lot of public service events and have tried several times to use APRS during an event. It seems most hams have one radio, but find it troublesome to have another with associated antennas, cables etc, to run APRS. Using one radio on the main repeater frequency is an idea we too have been toying with. Sign us up for beta tests. We'll build our own PC boards or whatever, just fill us in on the plans.

Date: Thursday, August 03, 1995 9:35PM

I am about ready to begin testing of my widget for putting your stand-alone-tracker packets onto the tail end of your voice transmissions. I need some GOOD beta testers. Here are the requirements:
1) You must have a GPS and stand-alone-tracker
2) You must be a hanko and VIP in your repeater organization. ie, you must be able to make a lot of noise on your repeater (packets) without someone turning off the repeater on you!
3) You must have frequent access to the rpeater to install a TNC and a extra packet transceiver, and extra visits for troubleshooting and tweaking
4) You must be willing and able to install my small circuit board inside your TNC and find all the appropriate attachment points.
5) You must fully understand AX.25
6) You must be willing and able to tinker with the repeater controller and packet TNC to optimize the interface between them.

If you are interested, lemme know!

Bob (et al.)

The idea has a lot of appeal. If I thought that I wouldn't have to have 2 transmitters and two antennas ...
Unfortunately, although my license SAYS Tech.....
I'm also a little short in the "clout" dept. HOWEVER ..

Lemme fwd this to someone with all your qualifications and see what HE says.

Radios for APRS use!

In dealing with APRS and CAP, I found a member that is a dealer for Maxon. He told me about a 4 channel crystal HT that was re-engineered for data use and mounted in a very small stainless case with only a BNC and db-9 connectors. I ordered two for testing and they have served me very well. Especially since CAP has ONLY one packet freq nation wide. Since my testing, several others have been purchased and used as mobile units for trackers.

The unit puts out 5 watts, is about 6X3X3/4", never gets hot, and you can order it with crystal. It connects directly to the TNC/KPC3 and makes for a very small package. I don't have the specs here with me, but they come with a very nice tech manual with full schematics.

I recall the list price was about \$200.00, I managed to get the 3-4 that I have purchased for \$150. each in ones. I was told the price drops a lot if >10 are ordered!

Anyone interested? As usual...I have nothing to gain in this, just passing on my experience with these little units!

For \$150, I'd be willing to try one out, especially to see how it fares in a high-RF environ and to see if it can do 9600bps.

Has anyone done any testing on some of the less expensive data radios
available as far as sensitivity and selectivity and total IM rejection?

The MFJ comes to mind as well as the Maxom recently posted.
Not everybody runs these as mobiles with GPS. I am personally interested
in suitable radios for remote digi sites.

Those sound nice. Maxon is getting a better name these days. They
previously had sort of a low-class reputation. These sound similar to the
TEKK data radios that we use for UHF. I wish TEKK mave VHF one!

How big is the case and how much does it weigh (for balloon use).

Thanx

Ralph

>The opinions expressed in this message are those of the author only,

I just now went back and (re?) read your message of July 20th..

Sorry I didnt get back to you sooner..

We are slowly working on a new version of PacketTracker that will do all of this and more. If you have not seen PacketTracker, download it from TAPR, it is worthwhile, but realize it is a couple years old.

The new version of PacketTracker will be out sometime in the next year and will do ALL sorts of network analysis of packet stuff.

Rendered body type: text/plain

>>Here is the current list of ANSWER MEN for frequently asked questions.

[stuff omitted]
Jeff.Brenton@espi.com MFJ 1200/9600 baud radios

Oh, sure! I get a couple of radios, and suddenly I'm an expert! [grin]

I'll do what I can, but I'm just digging into the MFJs myself. Found today that you DO have to re-tune them for any crystal change - the crystals they supplied for 145.790 are far enough off that you can hear it in the signal audio, but not QUITE far enough off that a radio *close in* with a wide AFC can't pull them in MOST of the time... Need to get my counter out of storage, and tune it up.

NONE of the Hamtronics stuff I've built came up this far off frequency! With them, it's tweeking to get them within 100 Hz, rather than within 10 KILOHERTZ... Is it the quality of the crystals, or the stability of the transmitter? Only time will tell...

89. SIG member location file?

From: "Bruce W. Martin" <martinbw@TEN-NASH.TEN.K12.TN.US>

Rendered body type: text/plain

Yes!! It looks like a GO

Atlanta Balloon Update as of 3 August 1995:

All equipment for all packages on hand.
Payloads modules tested. Final integration complete.
Launching from Crossroads, GA. (NW of Dallas)

ATLANTA BALLOONATICS

Balloon #4 Mission Status

DATE/TIME

: Saturday August 4th or Sunday August 5th
: Release 0930EDT (1330Z) 0930EDT (1330Z)
: Weather conditions will control exact time of release

RELEASE SITE:

: Crossroads Elementary School, North of Dallas, GA
 WB8ELK (Bill Brown) will be in attendance
: Coordinates 3400.48N 08446.12W

: Payload weight : 2.27kg (5-pounds)
: Balloon : TOTEX TA-1200
: Helium : 180 cu ft.
: Ascent rate : 750 fpm
: Max altitude : 110,000ft
: Max radio range: 640km (400sm)

FREQUENCIES AND MODES

: Packet Radio Downlink 441.0 MHz 2W
: Retransmitted from ground into APRS net on
145.79 MHz and on 10.151 MHz LSB
: Standard AX.25 1200BPS AFSK FM
: Sending APRS-compatible NMEA-183 GPS navigation data
: No Open digipeating. No receiver. Don't try.

: Altitude & Temperature telemetry on:
146.575 MHz , 28.322 MHz , & 438.5 MHz (wide band TV
audio)

: B&W ATV camera with 1 watt AM transmitter on 434.0 MHz

: All antennas vertically polarized

EXPERIMENTS : More experiments in BASIC stamp control of balloon payloads.
Basic Stamp controlled servo/mirror for
multiple camera views.
1 12 bit altimeter and 2 8 bit temperature
sensors (inside and outside)
data will be sent as CW on the 10 and 2
meter frequencies

To: aprssig@tapr.org
Message-ID: <199508051356.IAA03226@sh1.ro.com>
Rendered body type: text/plain

I want to participate in the Meteor Scatter Test coming up. I have a stacked pair of 13 element CushCraft 13B2's + a 300w Mirage at 48 feet. Now the question is when starting that function in APRS 72b it asks to enter the transmit power?. Now do i enter the power at the shack or do i figure the 300+w and multiply by DB gain. I don't know how important this is?. Also is there anything else i need to know. I have seen instruction posted here by several sources hi. Would be great if someone would post the final rules. I also understand that my best beam direction would probably be toward Bob's location 057 degrees, specially on the 12th of Aug. Any input would be appreciated. Now back to APRS and the possible balloon launch in Atlanta.

Rendered body type: text/plain

Central Illinois Balloon Association launched a balloon at 9am local time today 8-5, it landed at 40 47 N 088 54 W at 12:15pm.
Close to Gridley Illinois. The GPS failed giving altitude initially and lat/long data stopped 30 minutes into flight.
The crossband repeater was subject to simplex activity on the input frequency and may have caused desense (they think) with the GPS.

Stations N9FAM, WA9RGQ, WX9U, N9RLR, N9WST, KA9NHL, K9CYW and K9ORP participated. A full report will follow when I get it.

Is there anyone in the Pittsburgh PA area who can help me set up the APRS72B software by phone? All I really want to do is set it up for the meteor shower test. I'm not into the GPS stuff 'cause I don't drive. I'll even accept a collect phone call to get it set up. I've got 3 friends in this area who also want to be active in the test. One on 2 mtrs and and another guy and me on 6 mtrs.

Thanks in advance
Mike

Good show despite some set backs! Enjoyed seeing just how many aprs stations
there are on vhf. Will be looking forward to seeing another launch.

Many thanks to Bruce KB4LWN who called me from California within 2 hours of my posting the request for help! With his help we got the software going and now several of us in the Pittsburgh area will be operating the meteor scatter test on both 2 and 6 meters.

Bruce's enthusiasm for helping others is a VERY good example of what ham radio is all about.

Thanks again Bruce.

100. Newbie can't get his APRS to work!

From: Bob Hartman <n8mwz@alpha.wcoil.com>
Date: Sat, 5 Aug 1995 17:20:35 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.BSD.3.91.950805170815.999B-100000@alpha.wcoil.com>
Rendered body type: text/plain

Excuse this message if it too elementary, but it is darn frustrating to me that I can't get APRS to run on my system. I keep getting an "I/O glitch" and "TNC not responding" messages in the top RH corner and gibberish on the bottom line of the screen. If I hit "O,C, & T" to test it as explained in the "trouble.txt" file, I either get "I/O glitch" (which usually locks the computer up) or gibberish instead of the CMD prompt. If I power the TNC down and back up in this screen, I get a couple of line of gibberish (looks like Greek). Let me first say that this particular TNC and computer work fine together for normal packet using Telix as a terminal program. I have a new Kantronics KPC-3. (ver 6.0 with the GPS firmware) I am using a commercial premade (all 25 pin) serial cable between the computer and the TNC. The TNC is on COM 4 and I have switched it with the serial cable for COM 2 which is a modem with the same result. I edited the INITTAPR.TNC file to change PAR to 4 after the intial setting didn't work either. I also temporarily removed the third line down in INITTAPR.TNC (W?len 8) on the advice of another person who had to do that to get his KPC-4 to work properly. So far, nothing make any difference. The computer is a DX4-100 with normal bus speeds.

Any suggestions???

After a 1 hour weather hold,our balloon was launched from Crossroads Elementary School near Dallas, GA. Bill Brown (WB8ELK) and his girlfriend were there to lend a hand.

We even had an unplanned experiment: "Ants in Space" (with apologies to Gerry Creager's cows). Someone had set the GPS payload down on an anthill, and we were going to have the first amateur "Antronauts". :(

At liftoff, something caused the bottom payload (the GPS/TNC/TEKK Radio) to separate from the flight train. This caused the balloon to ascend with only the ATV payload, Radar reflector, parachute, and 10 and 2 meter beacons.

Those payloads worked flawlessly, and the fox hunters DF'ed the balloon with the aid of APRS and manual beam headings, handi finders and Doppler units. A local fellow has a Company (Directional Systems) that makes a NICE Doppler unit.

After a two hour flight, the package landed on a farm, in a 100 ft high Sweet Gum tree. The farmer tried to shoot down the package for us with a rifle, but couldn't get all the strings. His son finally felled the tree and

we cut it up into logs and stacked it for him. The payloads, including the video with servo controlled moving mirror all worked while the balloon was in the tree and during the tree felling.

By the way, the first person to the balloon was WB8ELK. I know telemetry was received in Huntsville by KE4EER. Any one else receive our beacons?

We'll post some images on the web site soon. And I will post the HST file of the DFing activities as well.

We have 1 balloon and 1 tank of helium left, so we'll fly it again soon (ALL of it, I hope)

For more details about this project, as well as telemetry decoding charts- see the WWW address listed below

Bob.. a friend had this problem.. and it was his Parity not being correct for APRS...

i think he was 7/E/1 and this program wanted 8/N/1...or vice-versa..

and when i have an I/o glitch here.. its because i look back at my Com2 and see my mouse plugged in..

o well

Hello Dale here qth Naples FL- I am writting a program to run on an old 286 located

at the local Emergeny Operations Center which parses the incoming hurricane and

other tropical storm info off of the weather wire and sends it to the co-located packet

bbs. I am adding the ability to call the local voice repeaters and program the info into the

digital voice "talkers". In the process of doing all this I have the info necessary to output

APRS automatic info and have been able to get most of the graphics to work properly-

I have some problem with deciding what kind of decay to put in the output- the tropical

cyclone info is good for between 1 and 6 hours- depending on how close the storm is to

landfall. there is not enough APRS activity here at present to even guess at the qrm level that could be tolerated. Any Ideas?

Hi Bob;

Soundslike a baud rate or parity problem with your RS232 link between your computer and TNC. Check to see that APRS and the TNC are set the same.

I want to thank everyone who send me suggestions as to why I couldn't get APRS to run on a Kantronics KPC-3. In the cold light of day, and with everyone's suggestions, I was able to determine that I had to change *TWO* settings at once to get it to work. All of my testing previously was to change change one thing at a time and check it, etc. On the KPC-3, it requires the statement "PAR" to read "PAR NONE" as the KPC-3 does not use "0", "1", "2", "3", or "4". Once I changed the Parity to none and matched the baud rate of the APRS program to the ABAUD setting of the TNC, everything worked fine. Thanks again to all that responded!

Hi Bob:

I cannot typcially get my tnc (AEA PK-232) and any revision of APRS to run from scratch. Almost every time I have to run Procomm+ or similar comm program first, get ths tnc to give its normal "cmd:" prompt, then switch to APRS.

I suppose I'm doing something wrong. What else is new? Maybe some kind soul will enlighten me/us as appropriate.

108. 6M APRS METSCAT Test, Part-III

From: Ralph Wallio <WALLIO@dsml.dsmnet.com>
Date: Mon, 7 Aug 1995 7:13:13 -0500 (CDT)
To: aprssig@tapr.org, vhf@w6yx.stanford.edu

Rendered body type: text/plain

1995 Perseids 6M APRS Packet Radio METSCAT Test
Ralph Wallio, W0RPK and Carl Richey, KB0QQQ

Test Information Part-III

W0RPK will transmit APRS compatible packet radio beacons on 50.620MHz during the 1995 Perseids meteor shower. Automatic transmissions of 100-packets will occur during the first half of each minute using standard 1200BPS AFSK on FM modulation. During the second half of each minute W0RPK will monitor for packets from other stations. The test will start at 0001UTC 11Aug and end at 2359UTC 14 Aug (Thursday evening to Monday evening CDT).

The W0RPK station configuration will include 160W into a 5-element horizontal home-brew Yagi and separate transmit and receive TNCs and microcontrollers. The receive side is fairly conventional while the transmit side, based on an ancient Radio Shack TRS-80 Model-100 lap-top, is specific to this test. When in beaconing mode, the transmit controller will generate date and time stamped serial-numbered beacons using a very simple BASIC language program:

```
10 ' Packet Radio Meteor Scatter Beacon Transmit Controller
20 ' Written for the Radio Shack TRS-80 Model-100
30 ' Ralph Wallio, W0RPK wallio@dsml.dsmnet.com
40 '
100 ' Open RS-232 serial port for settings
    ' 1200bps, 7-bits, even parity, one stop bit, enable x-flow
110 OPEN "COM:57E1E" FOR OUTPUT AS 1
120 '
200 ' Set beacon serial number counter
210 J = 1
230 '
300 ' Loop looking for top of each minute
310 IF RIGHT$(TIME$,2)="00" THEN GOTO 410 ELSE GOTO 310
320 '
400 ' Transmit loop
410 Beep
420 FOR I = 1 TO 110
430 PRINT #1,MID$(DATE$,4,2);" ";LEFT$(TIME$,5);J
440 J = J+1
450 NEXT I
460 '
500 ' Log transmission to printer
510 LPRINT DAY$;" ";DATE$;" ";TIME$;" ";J-1
520 '
530 ' Return to timing loop
540 GOTO 310
```

A terminal program will be used to put EN31FK in the TNC UNProto field. This BEACON program will run continuously until a 2-way QSO attempt is scheduled. After the attempt, J will be set to the next serial number in line-210 and the program restarted.

A similar QSO program will be used during 2-way attempts:

```
10 ' Packet Radio Meteor Scatter QSO Transmit Controller
20 ' Written for the Radio Shack TRS-80 Model-100
30 ' Ralph Wallio, W0RPK wallio@dsml.dsmnet.com
40 '
100 ' Open RS-232 serial port for settings
    ' 1200bps, 7-bits, even parity, one stop bit, enable x-flow
110 OPEN "COM:57E1E" FOR OUTPUT AS 1
120 '
200 ' Input text to be transmitted and station call
210 INPUT "Text";T$
220 INPUT "Call";C$
230 '
300 ' Loop looking for top of each minute
310 IF RIGHT$(TIME$,2)="00" THEN GOTO 410 ELSE GOTO 310
320 '
400 ' Transmit loop
410 Beep
420 FOR I = 1 TO 110
```

```

430 PRINT #1,T$
440 NEXT I
450 '
500 ' Log transmission to printer
510 LPRINT DAY$;" ";DATE$;" ";TIME$;" ";C$;" ";T$
520 '
530 ' Return to timing loop
540 GOTO 310

```

The user interface of this alleged 'program' is very crude but I will only be using it for a few days and a few attempts. The following operational steps will be used:

- 1) Model-100 TIME\$ is set to WWV.
- 2) A terminal program will be used to load the distant station call into the TNC UNProto field.
- 3) The program will be stopped and restarted every time required TEXT data changes.

I am open for QSO or beacon skeds in the announced test interval.

Do you want stations running APRS on this freq. This sounds like you are looking for confirmed(at the time of contact) contacts. I thought the APRS Mscat mode was set up to provide min packet length and all vis UI frames.

CAP National Data Radio Network News - 31 July 95

* * *

APRS News

Let me clarify an issue that has caused some confusion. As reported in last month's newsletter, Arizona Wing has completed their testing of APRS and has written a report on the results. In addition, they have written a 48 page technical manual on APRS and how to build a stand-alone APRS beacon using the Motorola GPS units.

However, these documents are not yet available. The report was written for the NCC. So even though the NCC no longer exists, it will be released at the National Board this month.

After the Board, request copies of these documents from your Director of Communications.

Pennsylvania Wing now has a small cadre of APRS Users running tests. Since PAWG nodes support Unproto packets, they are able to digipeat APRS packets.

There will be very few participants on 6M and the METSCAT foot print effect will further limit QRM. For the moment, I plan on using 50.62MHz for both APRS beacons and QSO attempts. Ralph

I'm not a member of CAP, but would be very interested in obtaining copies of the documents mentioned above.

How would I go about doing this?

How much would it cost?

It might be interesting if this could be made available at tapr's ftp
site as well, especially for those of us not associated with CAP.
Just my opinion, however.

APR REPLY: No, this list (being assembled by Keith) will NOT have digis in it. But I am trying to maintain a list of ALL KNOWN PERMANENT WIDE area digis in the file DIGIS.BK that is in all aprs distro copies. You can not only load this file as a backup file, but you can also REPLAY it so that you can temporarily see the digis, without losing your current data.

Jess,

I've had a similar problem with a PK232. The PK232 doesn't seem to want to autobaud properly with APRS. I solved the problem by putting the batteries into the TNC, booting from a viable packet program, and then subsequent connections via APRS are no longer a cold boot. It now comes up ok every time.

Btw, don't forget to include the word PACKET in the INITAEA reference file so it doesn't come up in MORSE.

Bob,

For the wish list I suggest that in some future version you add an autodetect mouse configuration capability. I note that 7.2b honors the Microsoft Mouse. However mine is a Logitech Bus Mouse and APRS doesn't even know that it is there.

Priority is "not important ... nice to have".

To respond to Bob Baltz question about packet format on SIX METERS for the meteor shower.

On six meters, success should be routine. Therefore, If you are NOT at your station, then let it run automatic with the APRS MScat mode. If you are in attendance, and see a contact, then GO FOR A TWO-WAY.. Ralph has pretty well described how...

I will try to revise Ralphs program into an EXE program... if I have the time....

More later, after I digest 3 days of mail here....

120. 6 m MScatt plan REVISED?

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Mon, 7 Aug 1995 20:45:54 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950807203037.15110A-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

I believe that the complete TWO-WAY protocol proposed by W0RPK can easily be added to a new version of APRS FOR 6 METERS ONLY. I will work on that immediately. BUT in the mean-time, I am hoping that Ralph will ADD 3 characters to his packets. This is beacuse ALL versions of APRS must have at least 3 characters before the packets will be considered in ANY MODE. For this reason, I am adding the 3 characters (CQ!) to his calling packets, and suggesting that all Snn packet counts be padded with a leading 0 to guarantee at least 3 characters at all times. If he disagrees, he will tell us! hi hi (its after midnight so I dont want to call him) Here is a REPEAT of his proposal MODIFIED to assure a 3 character minimum:

W0RPK will transmit APRS compatible packet radio beacons on 50.620MHz using standard 1200 baud AX.25 FM. Automatic transmissions will occur during the first half of each minute. During the second half of each minute W0RPK will monitor for packets from other stations. The test will run from 0001UTC 11Aug to 2359UTC 14 Aug.

Beam headings will be controlled by 2-way QSO attempts, by requests for specific beacon paths and to take advantage of predicted path peaks.

A complete METSCAT QSO requires both stations to receive and display a minimum of one packet containing both calls, one packet containing a signal report and one packet containing a signal report ack. He suggests the following protocol for 2-way packet radio METSCAT QSOs:

- 1) Both stations transmit multiple packets (100+) for 30-second intervals with the opposite call in the UNProto field. (W0RPK will transmit in the first half of each minute.)

W0RPK>WB4APR:CQ! (no other text) 00-30 seconds
WB4APR>W0RPK:CQ! (no other text) 30-60 seconds

- 2) When either station displays one or more packets containing both calls, that station will add a short signal report in their text field. Reports will be `Snn' with nn being the total number of packets received.

W0RPK>WB4APR:CQ! (no other text) 00-30 seconds
WB4APR>W0RPK:S06 30-60 seconds

- 3) When either station displays one or more packets containing their signal report, that station will add `R' in their text field indicating receipt of their signal report.

W0RPK>WB4APR:S03 00-30 seconds
WB4APR>W0RPK:S25R 30-60 seconds

- 4) When either station displays one or more packets containing acknowledgment of their signal report, they will add 73 in their text field indicating receipt of the acknowledgment.

W0RPK>WB4APR:S27R 00-30 seconds
WB4APR>W0RPK:S65R73 30-60 seconds

- 5) Both stations must display calls, signal reports and acknowledgments before the QSO is complete.

W0RPK>WB4APR:S32R73 00-30 seconds
WB4APR>W0RPK:S72R73 30-60 seconds

Each station should transmit as many UI packets as possible in it's assigned 30-second interval. W0RPK will be using a transmit controller running a simple program to save wear on the <ENTER> key (and operators).

I did it. In version 72c, I just added a modified SEND command which can be used during MScat. It only permits one send line, but allows you to send the W0RPK proposed responses to make a valid TWO-WAY contact via MS. The only difference to W0RPK, though, is that it retains the 15 second timing vice the 30 second timing he proposes. I am NOT against the 30 second timing, but just dont have time to change that portion of the code... and test it...

I will upload these tomorrow after I go home and find the latest copy of MAPFIX15 which some folks are also waiting on...

THAT MEANS YOUR DISK IS FULL!

Since APRS automatically saves track histories and LOG files whenever the arrays fill up, you will find that sooner or later APRS will fill up your LOGS and HSTS directories.

Unless you have any need for these files, delete all the files in the LOGS directory, and delete all TK*. * files in your HSTS directory. If there is a particular.HST file you want to keep, simply rename it to something more descriptive, and delete the others.

125. APRS72c is posted

Rendered body type: text/plain

APRS72c and upgrades (7bto72c, 71to72c, 72ato72c.zip) are now posted on the sig. (tapr/SIG/aprssi/upload). This version only has TWO changes:

- 1) It has a new MAPFIX15.bas/exe which should have a better CLEAR-PTS function for clearing those pesky single points during map making
- 2) A new SEND function for MeteorScatter. This is needed if you are going to try to make a valid 2-way MScat contact on 6 meters. See the new METEOR.txt file. It lets you send the W0RPK proposed message exchange needed for a valid TWO-WAY contact.

I think that 2 meter MScat will be so rare, that it won't even be worth trying this new msg feature. So if you have 72b and are on 2m only, then dont bother downloading the new files. Good luck.

1995 Perseids 6M APRS Packet Radio METSCAT Test
Ralph Wallio, W0RPK and Carl Richey, KB0QOQ

Pre-test test

W0RPK will transmit APRS compatible packet radio beacons on 50.620MHz during the 1995 Perseids meteor shower. Automatic transmissions of 100-packets will occur during the first half of each minute using standard 1200BPS AFSK on FM modulation. During the second half of each minute W0RPK will monitor for packets from other stations. The test will start at 0001UTC 11Aug and end at 2359UTC 14 Aug (Thursday evening to Monday evening CDT). I am open for QSO or beacon skeds.

The beacon system will be on-the-air Wednesday and Thursday, August 9-10, 0000-1400UTC for a shake-down cruise. Please post reception reports on this net.

130. WX Data Strings for NHS

From: JKANDEL@umiami.ir.miami.edu
Date: Tue, 08 Aug 1995 14:42:44 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <01HTU18PH27MA90LG9@umiami.ir.miami.edu>
Rendered body type: text/plain

I have been asked by the NWS and amateur folk at the National Hurricane Center to request that people putting out wx data strings on APRS especially during hurricanes keep units of wind speed in KNOTS and pressures in MILLIBARS.

Keep those APRS reports flowing. They ARE being monitored at the National Hurricane Center.

131. Voice REPEATER TNC interface

Here is my suggested interface for a TNC to a voice repeater controller so that it can pick off packets from the repeater input and mute the repeater output so that voice users do not hear the packets. It also uses the repeater kerchunk filter to prevent the repeater from even keying up on single packets when the repeater is not in use for voice.

2) If the repeater is NOT on the air, then a short packet will briefly open the squelch, but as soon as data appears, the COS is canceled so the Kerchunk timer in the repeater controller will assume this was just a brief kerchunk and never even key up the repeater. Even though the packet may be more than a second long, the kerchunk timer can be as short as 0.25 seconds or less, since the DCD cancels the COS.

```

RCLR      1k      CONTROLLER
COS  >---/\/\\/---*-----> COS INPUT
                                     |
                                     b | c
+5v  >---/\/\\/---*-----*-----| NPN
                                     | * e
TNC      10k      b | c
DCD  >---/\/\\/---| NPN      =====
LED      | * e      | 1uF      |
GND  *-----*-----*-----*-----GND

```

If you have access to your repeater controller. Begin planning to add this circuit. APRS position reports on voice repeaters is coming!

Bob,

>Here is my suggested interface for a TNC to a voice repeater controller

A couple of questions?

What is the min/max time for a posit to xmit.. assuming that raw gps is max!

What happens with 'PL' on the repeater? 50-75% are PL'ed here in AZ!

Joel, the standard pressure entry is supposed to be the last three digits
in millibars....says so when you make the entry....ie: 083 is 1008.3
millibars....783 is 978.3 millibars...If the reading goes below
950...well its time to duck and cover anyway....

Perhaps the weather data could be repeated in the beacon text....such as
Cloudy/Breezy/1008.3 mbs FR/Wind 0225G30...

1995 Perseids 6M APRS Packet Radio METSCAT Test
Ralph Wallio, W0RPK and Carl Richey, KB0QQQ

Report on 1st pre-test

W0RPK will transmit APRS compatible packet radio beacons on 50.620MHz during the 1995 Perseids meteor shower. Automatic transmissions of 100-packets will occur during the first half of each minute using standard 1200BPS AFSK on FM modulation. During the second half of each minute W0RPK will monitor for packets from other stations. The test will start at 0001UTC 11Aug and end at 2359UTC 14 Aug (Thursday evening to Monday evening CDT). I am open for QSO or beacon skeds.

Results from 1st pre-test:

08Aug

23:59 W0RPK started beacon s/n 1

I recently downloaded the USGS2MAP.BAS and tried to run it, after having some success with the 1.200,000 scale data. I wanted to try the 1.100,000 data with the usgs2map.bas and got the error in the file i've downloaded 2 times. There was a bad line that has the first missing.

Can anyone help out with where to get a good version from ftp site?

I got a sample of the 1.100,000 data to try building more detailed maps of south Georgia, and the one I have has a .gz extension, the other 200,000 had the extension mentioned in the other basic program and it worked. Have I got hold of the wrong data file?

Thanks in advance for the help, from South Georgia, where we need better maps.

This is a SIX meter list of participants. Since we expect lots of stations on 2 meters (every APRS station in the country), we will not make a 2 meter list until reports come in, if any...

SIX METERS:

CALL	GRID	AREA	SUCCESES	(p means posit, * is 2-way)
------	------	------	----------	-----------------------------

W0RPK		IOWA		* (early tests on 9 aug)
K0BI	EN72bm	Grand Rpd	MI	*
N3MNT	FM19sa	Maryland		
W3ADO	FM18sx	Maryland		(just found out my radio only puts out 5w!)
VA3MW		Ontario		
W5SR	DM95cf	Amarillo	TX	
KN6PE		CA Bay area		
KD6SQ		Calif ?		
W0LCP	EN35jk	Minneapolis	Mn	

For now, report successes only. If you are on 6m and not on this list, please let us know.

Still looking for tech manual on the Maxon radio, but here is some more tidbits!

Maxon VHF radio
Model - DM0515
Size - 2 3/8 x 4 7/8 x 7/8 case only without BNC and DB-9, with about 5 1/2"

I stated that it was from a 4 channel ht, but this version has no switch to change channels, therefore it is basically a single channel, without rigging..it will hold 8 crystals tho.

I'd prefer not to do this buying/selling thing, so if Paul(Paccomm) or someone else has a source then speak up. I have received 8-10 requests since posting last week!

Later

Hi everyone:

I just bought a IIMorrow Apollo Precedus GPS at EAA Oshkosh airshow but was unable to get the serial cable. Cable now on order from factory. Hopefully, the cable will be accompanied by some instructions but I have my doubts since the cable was originally intended to be accompanied by a computer program to allow database updates and that software is not ready for release.

The Precedus menu and accompanying manual indicates serial output modes of NEMA 0183- 1.5 and NEMA 0183-2.0 but there are no other explanations. Any body got info or thoughts Thanks Barney W8KJM

Hi,
Congrats on your flight! Hope you didn't leave it up there!

EOSS has encountered occasional gps dropouts as well. Last flight, we changed the "look angle" parameter to include the horizon, and we kept solid lock from preflight thru recovery. Might give that a try.

```

The "language" of NMEA 0183 is extensive but not difficult to understand. The ground rules are these: maximum sentence length is 80 characters including the starting "\$," the terminating <CR><LF>, and everything in between. Minimum number of data fields is two, including the address field (talker identifier and sentence format). If data for any field is unavailable, a "null" field, two commas with nothing between them (",,") can be sent instead.

Ref. MAXON specifications message

I have found the DM series to be good radios for 1200 AFSK and 2400 MSK work, but not very good for 9600 DFM. We've tweaked on them a lot, but the recovered eye pattern is always marginal.

They are in the same price class as the TEKK KS-960. Contact me privately if you want sales or pricing information.

A friend of mine (W4DUF) has the Tiny 2 MK II with the built in GPS. Is there anyway to talk directly to the GPS portion of the TNC. He needs to slow down the data output interval from say 1 second to some slower.

He also get an occasional ERROR 6 message. What is this?

Thanks,

Tom

It took me awhile to remember where I saw this but her it is. I am looking at the ARRL Operating Manual, third edition dated 1988. Chapter 4 on Antenna Orientation has a section on "Direction and Distance by Trigonometry". In my book it begins on page 4-4. On page 4-5 there is a Basic program to solve for distance and bearing. 73

Subject: [APRSSIG:2256] Distance formula?

I'm working on a little program to take a history file and general a summary of it, including the actual distance covered (measured from point to point). We're in the middle of moving, and all my reference books are packed away, so I wonder if anyone can send me the formulas to generate distance and bearing between two points specified in lat/long.

Thanks.

John

159. 6m MScatt scorecard (2)

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 10 Aug 1995 15:21:23 -0400 (EDT)

This is a SIX meter matrix of known stations for recording packets. Since we expect lots of stations on 2 meters (every APRS station in the country), we will not make a 2 meter list until reports come in, if any...

SIX METERS			W
CALL	GRID	AREA	Ø K
			R Ø
			P B
			K I
-----			-----
WØRPK	IOWA		. * 2-Way (early tests on 9 aug)
KØBI	EN72bm	Grand Rpd	MI * 2-Way
N3MNT	FM19sa	Maryland	1 One packet printed (11th @ 0600z)
W3ADO	FM18sx	Maryland	1 pkt heard (TNC not connected 1330z)
VA3MW	Ontario		

W5SR DM95cf Amarillo TX
KN6PE CA Bay area
KD6SQ Calif ?
W0LCP EN35jk Minneaplis Mn
W9DHK DM13ao So. Calif

For now, report successes only. If you are on 6m and not on this list,
please let us know.

Subject: Information about MAXON DM-0515

MAXON DM-0515 GENERAL SPECIFICATIONS

Power Supply	10.8VDC+/-5%
Antenna Impedance	50 ohms, unbalanced
Temperature Range	-30 degrees C. to +60 degrees C
Humidity	90%, non-condensing
Frequency Range	148 MHz to 168 MHz
Frequency Stability	+/-0.0005%
Frequency Control	Quartz crystal, installed
Channel Capacity	1 channel, simplex or half duplex

Required FCC Compliance Part 15, 21, 90, 95

RECEIVER PERFORMANCE SPECIFICATIONS

Sensitivity	0.35 V or better (12dB SINAD) (1)
Noise Quieting	20dB or better at 0.5 V (1)
Receiver Recovery After PTT Released	18 milliseconds or less
Modulation Acceptance Bandwidth	+/-7.0 kHz
Spurious and Image Rejection	At least -70dB
Intermodulation Rejection	At least -60dB
Selectivity	At least -75dB at +/-25kHz of channel
Audio Output	At least 200mV RMS into 30K ohms @ 2.6kHz deviation with a 1kHz modulation tone
Audio Frequency Response	-4dB maximum @ 4.8kHz, down no more than -10dB at 770kHz (2)
Audio Harmonic Distortion	4% or less with a 10 microvolt input RF level, 1kHz modulating tone a +/-2.6kHz deviation. (1)
Receiver Current	20mA maximum

TRANSMITTER PERFORMANCE SPECIFICATIONS

Carrier Power Output	2 watts, +/-10% depending on voltage source
Audio Harmonic Distortion	No more than 5% for a 1kHz modulating tone at +/-3.0kHz deviation
Maximum Deviation Capability	At least +/-5kHz
Modulation Limiting	Instantaneous peak clipping with low pass audio filter
Audio Input Level	250 to 350mV RMS for 5.0kHz deviation @ 1kHz, adjustable
Deviation vs. Temperature	+/-0.2kHz over operating temperature range
FM Hum and Noise	At least -50dB down
Output Protection	Shall withstand for 5 minutes all VSWR around Smith chart of 20:1 without failure or damage
Input Current	Not more than 600mA with 2 watts average power output at 10.8V
Spurious and Harmonic Emissions	Less than -60dB
Attack Time Time from PTT to full power, frequency within tolerance, and full modulation capability	less than 50 milliseconds
PTT Input	Floating the PTT line enables the receive mode, grounding the PTT line enables the transmit mode.
Maximum PTT current sourced from the PTT line during transmit mode with the line tied to ground	30mA

(1): These measurements shall be made using a CC1TT weighed filter.

(2): These measurements shall be made without filtering.

Radio will operate OK in 2 meter band and MAXON will accept orders for such frequencies.

PacComm offers these radios at \$189 on your choice of frequency. Shipping extra. Delivery 3-4 weeks.

If there is a group order for the same frequency we can probably go for \$169. Lets say a minimum of 10 radios, paid in advance.

We're not making much on these radios - they cost more than a TEKK....

OPERATING IDEAS for 6m MScat:

1) There are two operating cycles for this event. W0RPK is transmitting during the 1st 30 secs, and listening the remainder of each minute. He is a good target if you want a two-way. Everyone else that is using APRS will be using the 15 second timing built into APRS based on the four quadrants of the USA. These two rules will allow you to figure out when to transmit and when to listen to contact any of the other 6m stations.

2) So if you want to work RPK and you live in either the NE or SE, then you will have to forcibly skew your PC clock by 15 seconds so as NOT to transmit when he is transmitting. But otherwise, the automatic APRS scheduling should provide a default assumption about when everyone else is transmitting.

This is a matrix of all known SIX METER stations for the Persieds Shower. Since we expect lots of stations on 2 meters (every APRS station in the country), we will not make a 2 meter list until reports come in, if any...

```

(Stuff omitted)

If stations are looking for a way to easily sync to NIST (the old WWV) there is a program called NBSCOM that was originally written for AMSAT ops for LEOSAT tracking that will use your modem, and call Colorado and set your PC clock for you. It won't do the 15 second offset that some stations will require, nor will compensate for slow/fast PC clocks, but will initially set your PC to the correct time (either local or GMT).

It's not very big, and I can upload a version of it here (as a UUencoded file), or place it on our FTP site if there is interest. It's also on COMPUSERVE.

To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950810204429.18223A-100000@greatlakes>
Rendered body type: text/plain

OK, Im finally set up at 0100z Thurs nite:

- 1) W3ADO-2: 400 watts on 2m into 18 db gain dish pointed from MD over Charleston to Tampa with a 10 degree beamwidth.
- 2) WB4APR-6: 10 watts (yuk!) on 6m pointed 286 deg from MD towards Iowa
- 3) WB4APR-2: 100 W on 2m pointed 286 deg from MD towards Iowa

LESSON LEARNED! Forgot about automatic collision avoidance! With three of us locals, if we all fire up in the same 15 second interval, the 2nd two TNC's wait till the channel clears, spreading packets well into the next 15 second interval! (even tho APRS sent them on schedule.)

FIX: If there are 3 locals you hear direct, then be sure to set your duty cycle to 33%. Two of you, go 50%. If there are lots, then maybe only the MOST POWERFUL should transmit.

PROBLEM: Problem is, the CONTROLS-XMT-OFF does NOT work for MS! ARGH@#\$\$!
If you exit MS mode so you can set C-X to off, then you wont see MS posits!

SOLUTION: Is for all low power stations to get out of MS mode, but be sure to set CONTROLS-FILTERS-OTHER on so that they WILL CAPTURE a MS packet, but it will just not be plotted on the map. You CAN see the guys Gird Square by looking on the D-LIST! Then use the OPS-FIND-[command to let APRS show you where that GS is..

ALSO if you are NOT in MS mode, then set CONTROLS-FILTERS-DIRECT to ON, so that your APRS will ignore all digipeated packets. This will make it easier to see the DIRECT signals only (even if they come from 1000 miles away!)

Keith Sproul-

As much as I try to check and double check, I (and others) can't seem to stop accidentally posting "private" replies to the SIG (as I just did before

this one).

Isn't there a way that the "Reply To" field can be left blank by the mail list program? This would force us to double check who we were sending the msg to?

I don't like to waste public bandwidth either, and I'll bet that a lot of these posts are accidentally made.

Anyone else feel the way I do?

Thanks

Ralph

Shouldn't be left blank but point to the sender of the message.
This list is the one which generates the most personal messages sent to the
listserv i've ever seen.
Suggestion: when you have a question for Bob (or ...), send it directly to
him, even if it is of general interest. When he answers to the list and
quotes the question everybody get it anyway.

Bernard, KB2TGH.

Doesn't work with Eudora, and I think it doesn't work with mail on a sun
workstation (using raw unix).

The problem is that:

Reply-To, Originator and Sender fields contain: aprssig@tapr.org

Reply-To should be the original address and not the list address.

Bernard, KB2TGH.

This is a matrix of all known SIX METER stations for the Persieds Shower.
W0RPK xmts for the 1st 30 secs of each minute. Others are assumed to
be using the automatic 15 sec APRS scheduling:

TRANSMITTING STATION -->			W	N
			0	K 3
			R	0 M
REPORTING STATIONS			P	B N
CALL	GRID	AREA	K	I T

W0RPK		IOWA	.	* *99 2-Way
K0BI	EN72bm	Grand Rpd MI	*	2-Way
N3MNT	FM19sa	Maryland	1	1 pkt @ 0200 on 10th 900 Mi
			*99	E opening.
			1	1 pkt @ 0224 on 11th 900 Mi
WB4APR	FM19sx	Maryland	+99	E opening
W3ADO	FM18sx	Maryland		(10W only, so dont bother looking)
VA3MW		Ontario		
WS5R	DM95cf	Amarillo TX		
KN6PE		CA Bay area		
KD6SQ		Calif ?		
W0LCP	EN35jk	Minneapolis Mn		
W9DHK	DM13ao	So. Calif		

For now, report successes only. If you are on 6m and not on this list,
please let us know.

If you are in the Neast or Seast using APRS, then you will need to skew
your PC clock by 30 secs if you want to try to work RPK.

175. 6M Packet METSCAT Test 11Aug 1200Z Report

W0RPK 6M Packet Radio METSCAT Test - 1995 Perseids
Test Report #1, 11Aug95 1200UTC

W0RPK will transmit APRS compatible packet radio beacons on
50.620MHz during the 1995 Perseids meteor shower. Automatic
transmissions of 100+ packets will occur during the first half of
each minute using standard 1200BPS AFSK on FM modulation. During
the second half of each minute W0RPK will monitor for packets
from other stations. The test will start at 0001UTC 11Aug and
end at 2359UTC 14 Aug (Thursday evening to Monday evening CDT).

W0RPK went on-the-air with beacons at 11Aug95 0000UTC as scheduled.
At 12 of 96-hours, all station control, logging and RF functions are
AOK. During this first interval, 77,000 beacon packets were
transmitted, 2-way QSOs were completed with K0BI (EN72bm 400-miles)
and N3MNT (FM19sa 915-miles), and a reception report was received
from W3ADO (FM18sx 915-miles). Beacon transmissions continue.
Antenna pattern will be east pending requests for other directions.

Test log:

11Aug95
00:00 W0RPK beacon system start s/n 1

Yea, I've thought about it. However, there are a few problems...first, the screen is quite limited in the number of pixels, so the maps wouldn't look good. Next, all the maps would have to be in the RAM soup at the same time, since there is no disk to keep them on, so forget about the 'Classic' Newton, even the 120 with its 2 MB would be awfully limited. A text only version could be done easily enough though.

Have you thought about how you would use it? Keep in mind you'd be limited to one serial port. In the mac, you don't have direct control over the hardware signals, so the scheme used by Bob for single port operation can't be implimented. I do not know if this same limitation applies to the Newton. There is a GPS that fits in the PC Card slot, and would be a way around that.

My feeling is that although it would be nice to have a handheld APRS station, a Newton, connected to a TNC and radio, and maybe GPS, would be at least two hands full. I don't think it is worth the effort.

I missed some of the original stuff on 6 mtr. I've got a 50w station that needs some work out.

Can someone post the freqs that we are to use for this testing?

Here is the beginning of a status nmatrix for 2m APRS DX

```
TRANSMITTING STNS --> W
                        A
                        1
                        Y
RECEPTION REPORTS:    K
CALL  GRID  AREA      N
-----
```

WB4APR FM19dx Maryland 33 @ 0500z 11th 373 mi (probbly tropo)

I also saw numerous consistent packets all night from stns 120 to 180 miles north along the coast in NJ and NY, so assume tropo was indeed present.

Tonight at 0000z the 30,000 watts ERP from the Academy dish W3AD0 will be moved to point 232 deg from Maryland towards Atlanta.

Due to the collision avoidance of TNC's (not accounted for in APRS MScat mode) it is recommended that, where there are more than 2 or 3 stns within simplex range of each other, that only the BIG guns remain in MS mode. All others should return to conventional APRS but set CONTROLS-FILTER-DIRECT and OTHER and FADE to ON. They should also still NOT have any digipeaters in their paths.

Then everyone should check their D-LIST in the morning and see which stations they heard direct. Center the screen on your station and use the MAPS-PLOTS-RANGE to measure the range to any other stations heard direct. If they are further than 250 miles, then report it.

You may use the MAPS-PLOTS-GRID command to see the grid square of the cursor location, and use OPS-FIND-[grid to find the location of any grid report.

180. resend or 6mtr stuff for those requesting

> do I hook it up to the Newton?
>

The canonical 3-wire mac connection works fine; I use to connect my GPS45 to my powerbook, and tried it on the newton (MP110) using Pocket Call version 1.0 from Ex Machina (800-238-4738). With this software, or some shareware comm software, you'll probably be set as far as the connection goes.

Here's the cable connection, as snipped from a previous post. Here in Silicon Gulch, the 8 pin mini din connectors are easy to find- Fry's has 'em. You should try Digi-Key for mail order.

If you get things hooked up and it doesn't fly, check for continuity between pins 8 (RX+) and 4 (GND) on the connector- you want pin 8 floating, or a bit above ground, to work with this setup.

That's the good news. The bad news is that the GPS45 jabbers quite a bit- I need to experiment to see if it will take the sort-of standard commands to turn off some of the messages and control the repeat rates on the ones I want to see (like \$GPRMC or \$GPGGA).

Bob...

One possible solution to the collision avoidance problems during meteor scatter ops would be to set FULLDUP ON, which causes the TNC to ignore the carrier detect output.

BTW, nothing heard here yet....

183. 2M Mscatt TXDELAY question

From: Bob Hartman <n8mwz@alpha.wcoil.com>
Date: Fri, 11 Aug 1995 15:37:16 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.BSD.3.91.950811153011.6321A-100000@alpha.wcoil.com>
Rendered body type: text/plain

Anybody got any idea for the correct TXDELAY setting when running an amplifier? (Mirage B2516G) I've never ran an amp on packet before but figured for the meteor shower test, why not! 160 or so watts into a 15.8dB beam might improve my chances a little. Mirage has been bought by MFJ and while their technical people seemed nice, they had no idea of how

long it takes one of their amps to reach proper transmit configuration after it senses RF. Any ideas received would have to be better than my "wild guess". (I am also assuming that since the amp keys from sensing RF, that I would have to add the normal TXDELAY setting for the radio alone to the figure for the amp)

>Anybody got any idea for the correct TXDELAY setting when running an
>amplifier? (Mirage B2516G) (rest omitted)

Isn't there a hard keying line on that amp? As I recall, this should be an active low line, and the TNC PTT signal should be able to drive it just fine. The big problem with RF-keyed amplifiers on packet isn't necessarily the key up time (though, it can be a concern) but the "release" time.... if there's any type of time-constant in there (other than the time it takes for the relays to switch the amplifier out of line) then there's a chance you'll miss ACK packets.

As for a delay, I'd personally recommend 600 ms of TXD delay. I usually run 450 ms anyway, which is about optimum for the "real" 1200 baud world out there.

APR REPLY: YES, EVERYONE DO THIS!!! (but then dont forget later...)

WITH FULLup ON, then everyone in the same area will ALL transmit according to the APRS sked and the collision avoidance will not cause constant QRM as it is doing now!

APR REPLY: SET TXD to 0 for MSCAT. Yes, the start up delay of the AMP and even the radio will cause the first packet to be lost, but you are sending 10 to 30 of the same packet at a time.

Although the TXD is only supposed to be applied to the first packet in a transmission, I am noticing that MANY TNC's seem to apply it to every packet! Just listen to the variety of MScat packets, even though all of them are being generated by the same APRS software. SO if your TNC is one of

those that is applying TXD to every UI packet, then setting TXD to 0 will cause your packets to be much shorter....(in a group)

Tandem-QM Gateway: Version K4.5
T0: APRS SIG [smtpgate@comm(aprssig@tapr.org)]

A few days ago, someone posted an idea on a "Radio Shack Cellular Extension" cable to move the GPS45 antenna away from the GPS unit.

After causing the local RS attendant much grief, we figured out that it is NOT a "Radio Shack Cellular Extension" cable but a "Dual Suction-Cup BNC Antenna Mount" RS pn 20-022.

Works great ! Adding a 90 ell BNC at the receiver end helps: "UG-306 Right-Angle BNC Adapter", RS pn 278-116b.

Hope this is useful to folks like me that use the GPS45 while mobile. The ant at the very front of the windscreen helps sat receiving a lot.

W0RPK 6M Packet Radio METSCAT Test - 1995 Perseids
Test Report #2, 11Aug95 2359UTC

W0RPK will transmit APRS compatible packet radio beacons on 50.620MHz during the 1995 Perseids meteor shower. Automatic transmissions of 100+ packets will occur during the first half of each minute using standard 1200BPS AFSK on FM modulation. During the second half of each minute W0RPK will monitor for packets from other stations. The test will start at 0001UTC 11Aug and end at 2359UTC 14 Aug (Thursday evening to Monday evening CDT).

W0RPK beacon transmissions continued for the remainder of 11Aug95 UTC. At 24 of 96-hours, all station control, logging and RF functions are AOK. During 12:00-23:59Z, a beacon reception report was received from Jeff, N4TRY in EM60nx (812-miles), no packets were copied from other stations, and the beacon packet count is now 159,745. The W0RPK antenna was redirected toward N4TRY at 19:25Z (150d). Beacon transmissions continue.

Test log:

11Aug95
12:01 W0RPK beacon system at s/n 77061

190. MScat SUMMARY How-TO

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 11 Aug 1995 20:35:53 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950811200244.6395B-100000@greatlakes>
Rendered body type: text/plain

The problem of the TNC's doing collision avoidance and therefore screwing up the APRS packet timing is SIGNIFICANT. I just posted upgrade files from 72a and 72c to APRS72D. Here are options for avoiding the problem:

- APRS72D.exe - Solves problem. MSCAT mode sets TNC FULLdup ON.
Also turns FADE off so you can see overnight packets
Also CONTROLS-XMT now works to toggle XMT on and off
Also now dual-port TNC's showing /x port numbers will properly display Beam Heading and MScat power
- APRS72C.exe - You must use O-C-T to set your TNC FULLdup ON. KAMS must also set MAXUSERS to 0/1 or 1/0 for this to work.
Also accepts 0 length BText in MScat packets
Also has MScat SEND command for valid 2-way on 6 m.
- APRS72B.exe - Same as C. You must set TNC FULLdup ON
Also added CONTROLS-FILTER-DIRECT command to MScat mode so that you capture ONLY DIRECT packets, (not digipeated)
- APRS72A.exe - Same as C. YOU must set TNC FULL dup on. I dont remember whats in A, nor whether it had any MScat modes
- APRS72 .exe - Same as C. You must set TNC FULdup ON.
First version with MScat mode.
- APRSxx .exe - For all older versions, there is no MScat mode, so simply set the following filters to collect MScat packets:
CONTROLS-FILTERS-OTHER
Then look at the D-LIST to see if you collect any DX packets DIRECT. If the direct DX packet has a gridsq in the TO adress, use the OPS-FIND-[gdsq to see where that guy is...

If everyone in your area does NOT have FULL dup ON, then you will hear multiple QRM packets carrying over beyond your 15 second window and those packets are BLOCKING your ability to hear any DX MScat packets! If for some reason a station is out of sync, have him QUIT MScat mode! He can still capture MScat packets by setting the filters above. (Plus set CONTROLS-FILTERS-DIRECT to on and FADE off.

If your local area straddles either 39 deg latitude or 95 deg longitude, then you will hear stations in two of the 15 second quadrants. You may want to move your QTH into the other area in order to have your packets coincide with the majority of your neighbors.

The Naval Academy 40 foot dish is pointed to Atlanta for Friday night thru Saturday day. Then Saturday night goes to Chicago thru Sunday day. Who wants it Sunday night? and Monday night?

Rendered body type: text/plain

Everything was going fine. Three stns running at work, and one at home. Going to bed about midnight but noticed erie silence. (I always like to leave the speaker on)... All MScatt stations had crashed!

Seems there was a bad packet being transmitted by someone. Ill tell you what it was later. In the mean time, SO THAT YOU DONT LOOSE A POSSIBLE DX PACKET>>>>

LEAVE APRS ON THE P-LIST!

If you crash, then at least you can see what you had.
Remember, D-list doesnt REFRESH in real time, and L-list in MScat mode will only possibly re-fresh on 1st packet from a station...
Now, about this 1 hour round trip back home..

193. MINAPRS ?

I have an extra IBM Clamshell (yep it's old). The upside is that it gets used twice a year for public service events (Atlanta Marathon and Peachtree Road Race), so it can be dedicated to APRS. The problem is that it has 512 K total memory. Anyone know what the word is on MINAPRS (I want to put this in the car and use GPS). Thanks in advance

Just in case you didn't know, the older version 6.8 will run fine in 512K according to a friend that has to use it. If you get a response via private Email as to an FTP site for the minimized version, I would appreciate it if you could also forward it to me.

N3HPR from EN92wb reports:

111403 (local time) N9GJJ>EN43ix 4358.7N/09117.0W beaming 90 degrees with 40 watts

Map-Plot-Range shows this to be 577 miles on a heading of 99 degrees from N9GJJ near LaCross, WI to N3HPR at Erie, PA

N9GJJ is Eugene R. Tetzlaff in Holmen, WI

Congratulatory e-mails can be sent to Tom, N3HPR at 74232.627@compuserve.com.

Tom plans to send Eugene a QSL.

Congrats guys. Is this the first reported contact?????

Dave, N3EOY

W0RPK 6M Packet Radio METSCAT Test - 1995 Perseids
Test Report #3, 11Aug95 1200UTC

W0RPK will transmit APRS compatible packet radio beacons on 50.620MHz during the 1995 Perseids meteor shower. Automatic transmissions of 100+ packets will occur during the first half of each minute using standard 1200BPS AFSK on FM modulation. During the second half of each minute W0RPK will monitor for packets

from other stations. The test will start at 0001UTC 11Aug and end at 2359UTC 14 Aug (Thursday evening to Monday evening CDT).

At 36 of 96-hours, all station control, logging and RF functions are AOK. During 00:00-12:00Z, no beacon reception reports were received, no packets were copied from other stations, and the beacon packet count is now 242,430. David Gaytko, WD4KPD in FM15ml, reports he has not displayed any packets during several hours of monitoring. The W0RPK antenna was redirected toward WD4KPD at 13:10Z (110d). Beacon transmissions continue. (A brief preliminary test analysis will be included in the 48-hour report.)

Test log:

12Aug95
00:00 W0RPK beacon system at s/n 159860
12:00 W0RPK beacon system at s/n 242430

Thanks for the contact report, Gene. Running running a Cushcraft Boomer here at 130 feet, with Kenwood 731A driving a 170 watt amp. This combination produces over 10,000 watts ERP. I was beaming at 250 degrees (presumably St. Louis).

For your info, Gene, Tom, N3HPR who received your meteor packet is just passively listening (XMITOK off, Bob) using a Kenwood rig and a Hustler G6 omni antenna.

Success is trickling in! Here is the status nmatrix for 2m APRS DX:

TRANSMITTING STNS:	W	W			W
	A	B	W	N	K
	1	5	8	3	1
	Y	N	R	E	H
RECEPTION REPTS:	K	L	Q	O	T
CALL GRID ST	N	J	Q	Y	V

WB4APR FM19dx MD	33			@110500z	373 mi	tropo?
N9GJJ EN43ix WI	1			@120423z	634 mi	
		1		@120423z	526 mi	
			1	@120602z	586 mi	
				1	@120639z	823 mi
				1	@120712z	1071 mi

APR also saw numerous consistent packets all night from stns 120 to 180 miles north along the coast in NJ and NY, so assume tropo was indeed present.

Satnight at 0000z the 30,000 watts ERP from the Academy dish W3ADO will be moved to point 290 deg from Maryland towards CHICAGO.

YOU MUST use O-C-T and set your TNC to FULL DUP ON to disable your TNC collision avoidance DCD circuit so that it transmits when APRS tells it to, and not after the channel goes clear!

Check your D-LIST in the morning and see which stations you heard direct. Center the screen on your station and use the MAPS-PLOTS-RANGE to measure the range to any other stations heard direct. If they are further than 300 miles, then report it.

You may use the MAPS-PLOTS-GRID command to see the grid square of the cursor location, and use OPS-FIND-[grid to find the location of any grid report.

Rendered body type: text/plain

I finally broke down, installed dosemu on my Linux box, and installed APRS.
Hey, DOS runs better under Linux than it does without ;-)

Anyway, it starts up nicely, except it locks up after it starts loading
USA.MAP. The com port stuff, etc works flawlessly, amazingly enough.

This is with APRS7B, which is the latest that looks halfway reliable :-)

root 7609 91.2 24.8 1532 1736 v02 R 10:39 2:25 dos

Dosemu is taking up most of my measly 486dx33, anyway, so maybe it's very slow
but working.

Any hints?

Bob et all,

Regarding Mirage amplifiers on packet, I have several, I am presently
using a G-3030 at 250 watts driven with a DR1200T for this Meteor event and
run normal parameters. The Mirage amplifiers seem to switch quite fast with
the switch in the FM position. I also have a B-1016 that works with normal
parameters. Over the years I have run 5 Mirage amplifiers with packet, and
have never had a problem with switching times. A TXD equivlent to 350 ms (35
on a KAM or KPC3) works fine...

Greetings frm the heart of Cape Cod...

WA1YKN is on the air beaconing Meteor Scatter signals during the first 15 second quarter of the minute beaming west. The station consists of a KAM controlled by APRS72c driving a DR1200T into a Mirage G-3030 Amp for 250 watts into a pair of 10 element beams stacked 110ft ASL (Above Sea Level) average terrain is 44 ft ASL.
The DR1200T is receiving thru the GasFet preamp in the Mirage Amplifier...

I thank the two stations reporting hearing this station in the midwest for reporting same, but as of this time, no signals beyond normal tropo range have been recvd at WA1YKN, I suspect due to heavy local APRS activity along LI sound...

I plan to opperate the station in this mode for the duration of the tests thru monday evening...

TNX, 73, Mitch, WA1YKN@AOL.COM

W0RPK 6M Packet Radio METSCAT Test - 1995 Perseids
Test Report #4, 12Aug95 23:59UTC

W0RPK will transmit APRS compatible packet radio beacons on 50.620MHz during the 1995 Perseids meteor shower. Automatic transmissions of 100+ packets will occur during the first half of each minute using standard 1200BPS AFSK on FM modulation. During the second half of each minute W0RPK will monitor for packets from other stations. The test will start at 0001UTC 11Aug and end at 2359UTC 14 Aug (Thursday evening to Monday evening CDT).

At 48 of 96-hours, all station control, logging and RF functions are AOK. During 12:00-23:59Z, numerous beacon packets were received from K0BI in EN72bm (400-miles). Many of these packets were in long groups, too long for meteor bursts (see log below). Es propagation is suspected. (Hmmm ... this test is turning out to be a pretty good Es sounding mechanism ...) The W0RPK beacon packet count is now 325,230. David Gaytko, WD4KPD in FM15ml (986-miles), reports he has not displayed any packets during several hours of monitoring. The W0RPK antenna was redirected toward WD4KPD (110-degrees) 13:10-15:19Z. Since 15:19Z, the W0RPK antenna has been pointed toward K0BI in EN72bm (75-degrees). Beacon transmissions continue.

Although we are working with a very small sample, positive and negative beacon reception reports are matching expected test performance. The following table gives optimum radiation angles and antenna heights for various meteor scatter paths:

Path (miles)	Optimum Elev (degrees)	Optimum Ant Height (Ft)	Note:
-----	-----	-----	
200	32	10	Performance is further optimized by tilting the antenna 15-25 degrees which greatly reduces vertical pattern nulls due to ground reflections.
300	20	15	
400	15	20	
500	12	25	
600	8	34	
700	7	39	
800	5	54	
900	4	68	

At W0RPK the antenna height is 14-feet (3/4-wavelength) with 0-degrees elevation. Beacon reception reports and 2-way QSO success match the table prediction. We have numerous successful QSOs and mutual beacon receptions with K0BI in EN72bm at 400-miles, a negative report from WD4KPD in FM15ml at 985-miles, a report of only two beacon packets from N4TRY in EM60nx at 815-miles. A QSO with N3MNT in FM19sa at 915-miles and beacon reception by W3ADO in FM18sx at 915-miles occurred during a brief opening when scores of packets were received at both ends.

This predicted and actual performance indicates a practical limit to the W0RPK meteor scatter path distance. We have, therefore, made arrangements to collect short path statistics with K0BI. The beacon system will continue for another 48-hours. The W0RPK antenna is now at 75-degrees to favor the W0RPK-K0BI path.

Test log:

12Aug95

12:00 W0RPK beacon system at s/n 242545
13:10 W0RPK antenna redirected to 110-degrees
14:43 W0RPK rcvd (1) K0BI 10W beacon

211. MScat LESSONS!

From: Bob Bruninga <bruninga@nadn.navy.mil>
 Date: Sat, 12 Aug 1995 21:39:27 -0400 (EDT)
 To: aprssig@tapr.org
 Message-ID: <Pine.SUN.3.91.950812213055.8028G@greatlakes>
 Rendered body type: text/plain

1) Please report MScat packets received in the format shown at the bottom of the 2 meter status report message that I just sent out. It has been hard gathering the information from the varioius reports filtering in.

2) APRS sechedules your transmissions based on the quadrant you are in. THINK about what this does to your intended receipient. I am only 1 mile south of 39 degrees, so I am in the 2nd quadrant, transmitting at 15 to 30 secs. If I am pointing my beam SOUTH to hit FLORIDA, then NOBODY in florida is going to hear me, since they are in the same quadrant and transmitting at the same time! I have two solutions. a) skew my clock, or b) move my QTH 1 mile north to be in the other quadrant.

In future versions of APRS, I will give you the option of selecting which quadrant you want to TRANSMIT in if not the default.

Living on the 39th parallel, we are having a devil of a time, since we hear locals in 2 quadrants...

Im glad this is working. I have only heard 1 burst on 6m and was starting to get depressed at all the wasted effort. But now I see that our poor receipts here are probably due to our own QRM...

212. 6m MScatt scorecard (5)

* Original Area: CHIHAM
* Original To : All (1:115/668)

I have 10 Motorola PVT-6 "black box" GPS receivers for sale.

These are perfect for APRS: RS-232 data output (no display), active antenna with cable, docs, new antenna mounting kit. You build your own data cable.... Rev. 8.3 firmware, all tested and ready to go.

These are more of the same units that we sold in the TAPR APRS-SIG a few months ago.

Same price: \$150 each, plus \$5 shipping in continental US

reply by e-mail to ka3hsw@amsat.org or Fido netmail to 1:115/668

These will go FAST!!!!

73 de KA3HSW

W0RPK 6M Packet Radio METSCAT Test - 1995 Perseids
Test Report #5, 13Aug95 12:00UTC

W0RPK will transmit APRS compatible packet radio beacons on 50.620MHz during the 1995 Perseids meteor shower. Automatic transmissions of 100+ packets will occur during the first half of each minute using standard 1200BPS AFSK on FM modulation. During the second half of each minute W0RPK will monitor for packets from other stations. The test will start at 0001UTC 11Aug and end at 2359UTC 14 Aug (Thursday evening to Monday evening CDT).

At 60 of 96-hours, all station control, logging and RF functions are AOK. During 00:00-12:00Z, we continued to receive numerous beacon packets from K0BI in EN72bm (400-miles). Again, many of these packets were in long groups, too long for meteor bursts (see log below). Es propagation continues to be suspected. No packets were received from other stations. The W0RPK beacon packet count is now 407,915. Testing with K0BI continues with the W0RPK antenna at 75-degrees. Beacon transmissions continue.

Test log:

George -

I'd like to buy at least one of your PVT-6 boxes. Can you hold one
 for me? I can get a cashiers check in the mail tomorrow AM if you'll
 send me your address. (Would like 2 if possible, but if the demand
 is exceedingly high (which i suspect it will be :-), I'd settle for one.)

Thanks!!!!!!

Hello, does it innclude all needed to operate the GPS reciever ? I'm in
Georgia and have wanted a GPS unit to stir activity in our area. Please
hang on to one for me until I can contact you by tele. Please leave your
number. I plan to use it here in demos to clubs in the area, and normal
costing systems are expensive for what i need. I anxiously await your
reply.

There are 5 stations here in South Georgia with stations online for the TEST.
WA4NTF in Ashburn is running 90 Watts on VHF
WA4NTF is also doing some operating on 6 meters , not sure of the power.

KB4TCU is operationg in Douglas with 850 watts

WD4LYV IN Sycamore is operating with 160 wats

KD4RJY in Tifton is running 50 watts

KE4JUC in Ashburn on 10 watts

I will gather a report from these stations and post what they have heard
here. As of Sunday afternoon I WD4LYV has not received any packets
outside Georgia... 73 de Wayne

6M Packet Radio METSCAT Test - 1995 Perseids
Test Report #6, 13Aug95 23:59UTC

W0RPK will transmit APRS compatible packet radio beacons on 50.620MHz during the 1995 Perseids meteor shower. Automatic transmissions of 100+ packets will occur during the first half of each minute using standard 1200BPS AFSK on FM modulation. During the second half of each minute W0RPK will monitor for packets from other stations. The test will start at 0001UTC 11Aug and end at 2359UTC 14 Aug (Thursday evening to Monday evening CDT).

At 72 of 96-hours, all station control, logging and RF functions are AOK. During 12:00-23:59Z, we concluded the 24-hour path test with K0BI in EN72bm (400-miles). Numerous packets were received, many long groups, too long for meteor bursts (see log below). Es propagation continues to be suspected. Several packet bursts were also received from WD4KPD in FM15ml (986-miles). A QSO attempt was initiated but with no success. The W0RPK beacon packet count is now 476,110. Beacon transmissions continue with the W0RPK antenna at 90-degrees.

Following is a crude scattergram of packet receptions from K0BI from 12Aug 16:00Z to 13Aug 16:00Z. More rigorous data analysis, including the reverse path, will be attempted after this test is complete.

Packets received

I know this Meteor Shower is generating a lot of traffic in your IN
boxes, but it will all be over TOMORROW! and we can get back to our
usual ratraces... and your D finger can get some rest....

I have learned 2 things about APRS:

- 1) DO NOT use the OPS-FIND-[grid square COMMAND with anything less than a full 6 character grid square. It will crash if you enter just [FM19 for example... (How do I know?... I lost a full day of MScat data..)
- 2) The INPUT-DF bearing RELATIVE does NOT work while mobile foxhunting... Until I fix it, you can enter all bearings in TRUE. But if you can figure that out while driving, you are better than I! If you use one of those nautical handheld "sight" compases, tho, it is trivial! Hang in there, we'll eventually get it working right...

P.S. Participated in my first find-the-tiny-box FOX HUNT. It sure humbles us DOppler guys.... What do you do at the end of the road?! Since I had NO hand DF equipment, I used the HT-on-the-chest with no antenna BODY-BLOCK method. I got within 6 feet when I spotted the box! The Body Block method works!!! (APRS was useless! hi hi)

Only problem was that the box said "change freq to xxxx and find the second box!" Again, the body block method worked perfectly!!!

227. Garminn 45 (Gardown7 to APRS.HST)

Here is a Basic program to take the Garmin 45 761 points stored in the track memory and convert it to a history file for use by APRS. You will need to obtain a copy of GARDOWN7 to use this program. Hope that this help the standalone tracker's for making Maps... The name I give this QBASIC program is GDN45HST.BAS

Hello Rand, WA2AGE

I've seen your request for the required settings for the KPC-9612 and am curious to know whether you've managed to obtain these settings and have been successful getting your KPC to function?

If you have been succesful in acquiring these settings, I shall appreciate it very much if you could PLEASE forward the instructions to us as well?

We've purchased the KPC-9612 with a Kenwood TM-251A 2M Tx and 70cm Rx recently and have been sending Packet Radio requests out by the heaps attempting to get in touch with other users of the sme or similar equipment ... with no joy! The problem that we are experiencing is that the rig has only ONE antenna plug and the KPC-9612 has TWO ports. We would like to use this set-up later on for PACSat and thus will hav to be able to rx on 70cm and tx on 2m. We are going to use a pre-amp at the 70cm antenna as well. What kind of solution can be worked out for a antenna system for such setup WITHOUT opening and modifying the rig itself (as it is off course

under guarantee)?

I have been looking for the plans/shematics for a discone antenna (dualbander for 2m and 70cm) as well. Also with no success.

Any chance you can perhaps put us on the right track Randy?

Your help/advice will be very much appreciated!

6M Packet Radio METSCAT Test - 1995 Perseids
Test Report #7, 14Aug95 12:00UTC

W0RPK will transmit APRS compatible packet radio beacons on 50.620MHz during the 1995 Perseids meteor shower. Automatic transmissions of 100+ packets will occur during the first half of each minute using standard 1200BPS AFSK on FM modulation. During the second half of each minute W0RPK will monitor for packets from other stations. The test will start at 0001UTC 11Aug and end at 2359UTC 14 Aug (Thursday evening to Monday evening CDT).

At 84 of 96-hours, all station control, logging and RF functions are AOK. During 00:00-12:00Z, a single packet was received from N0QVC in EN34GH at 199-miles. The antenna was slewed north in an attempt to copy more but without success. We also went silent for a while thinking we might be covering N0QVC APRS controlled transmissions but nothing more was heard. Our antenna was then slewed to the ESE for overnight tests with WD4KPD in FM15MM (or FM15ML?) at 986-miles. Eleven packets were copied, 10 in a single burst. Beacon transmissions continue with the antenna at 110-degrees. The W0RPK beacon packet count is now at 554,080.

Test log:

14Aug95
0000 W0RPK beacon system at s/n 476225
0108 rcvd (1) N0QVC APRS beacon
0151 antenna to 000-degrees
0152 xmitting S01 to N0QVC
0202 silent listening for N0QVC
0230 antenna to 110-degrees
0231 xmitting beacons at s/n 488760
0505 rcvd (1) WD4KPD APRS beacon
0627 rcvd (10) WD4KPD APRS beacons
1200 W0RPK beacon system at s/n 554080

To: aprssig@tapr.org
Message-ID: <950814123150_74102096@aol.com>
Rendered body type: text/plain

Greetings Fellow Participants,

Based on the information in APRSSIG:2436, 7/22/95, The Meteor activity level won't drop below the 25% level until 0800z, 15 Aug, 1995. Therefore, I will continue to operate WA1YKN in FN41tp until sometime late Tuesday morning, Aug 15th.

For the remainder of the test, from 1600z Aug 14th, I will position the beams on Atlanta, GA, which with the beam pattern of this antenna system should cover most of the deep south east of the Mississippi River...

Mitch...

235. GPS receivers

From: George_E_Henry <ka3hsw@neutron.pd.mcs.net>
 Date: Mon, 14 Aug 1995 10:30:32 -0500 (CDT)
 To: aprssig@tapr.org

 Rendered body type: text/plain

As predicted, all ten of the PVT-6 receivers are spoken for.

To be fair in allocating the 10 units to the more than 20 requests I received, orders will be filled in the order they were received.

Each of you who sent me a request will receive an individual reply, positive or negative.

Stay tuned.... still more may become available!!!

 To: aprssig@tapr.org
 Message-ID: <199508141710.MAA06323@sh1.ro.com>
 Rendered body type: text/plain

I'm still trying to get my GPS to work with my KPC3 and i'm having a lot of problems for some reason. I believe it's in the way the KPC3 is setup and i'll tell you why i think so. I made a special cable as Magellan requests tp Up/Dload waypoints using their software and that part works great although their software leaves a lot to be desired to say the least, then i hooked the Magellan to my serial poort and using Q-Modem had no problem reading the data, so i have to assume that the GPS is working ok. When hooked to the serial input on the KPC3 using a DB9 and hooking DATA+ to pin3 and DATA- to pin5 and setting the KPC3 according to someone else using a simular GPS (Magellan) i get one beacon showing the LAT/LON and the car icon. That's where the problem starts, i get only one beacon and NO updates at all although the GPS is updating without any problem. My setting are as follows.

```
BLT 1 EVERY 00:01:30
GPSHEAD 1 $GPRMC
LTP 1 GPS VIA KE4EER-5,WIDE
BEACON E 2
UNPROTO APRS VIA KE4EER-5.WIDE
MYCALL KE4EER-2
PBBS 0
MYREMOTE KE4EER-13
RTEXT XXXXXXX
INTFACE GPS
```

Then i turn KPC3 Off/On

I sure hope someone can find the problem for me. At first i figured as soon as i drove away from the house that my rig was not putting out a signal, but i checked all that and all is working great.

237. MScat Early Conclusions

From: Bob Bruninga <bruninga@nadn.navy.mil>
 Date: Mon, 14 Aug 1995 13:47:55 -0400 (EDT)
 To: aprssig@tapr.org
 Message-ID: <Pine.SUN.3.91.950814124320.2141D-100000@greatlakes>
 Rendered body type: text/plain

Well, we have one more evening, but here are my general conclusions. If you have any different conclusions or observations, please send them in, but maybe my posting mine early will stave off a lot of repitition...

TWO METERS:

1) 1200 baud AX.25 MScat on 2 meters works if you have HIGH POWER, a BEAM, a computer program for persistence, and a common frequency.

- 2) 2M Thru-put is so low, that MScat will only be useful for DX, not trfc.
- 3) Adding a MESSAGE RECEIVE function to match the MESSAGE SEND (in 72d) would add a little more fun and make valid DX QSO's possible.

SIX METERS:

- 1) 1200 baud AX.25 MScat is quite usable on 6m at 100 W and a modest beam.
- 2) 6M Thru-put is reasonable enough for simple QSOs.
- 3) DX and contesting are a good application under computer control
- 4) Point-to-point links for passing traffic may work at 1200 baud FM, but Once you go to the trouble to set up a link, you may as well optimize the DATA RATE and the MODULATION, for much higher throughput.

IDEAS: I think that there are several paths to take from here:

- 0) A few stations need to find a quiet freq and continue the same tests to see how ROUTINE MScat works compared to a SHOWER.
- 1) Fix APRS for maximum participation in MScatt 2m DX events (1200 bd FM)
- 2) Improve APRS for 2-way QSO style operations on 6m (1200 baud FM)
- 3) Develop a LINK protocol for moving traffic on 6 via MScatt
- 4) Pairs of stations begin testing 9600 baud FSK on 6m
- 5) Identify 2 widely separated freqs on 6m for FULL-DUX links.
- 6) Begin building a 6m POSITION REPORTING net using conventional APRS but without digipeaters. Mobiles transmit on a 10% duty cycle 100% of the time! All posits come in via MScat direct.

QUESTIONS: For the MScat experts, enlighten us on the following:

- 1) How does the average 160 ms APRS packets (abt 20 bytes) we were using compare with the optimum dwell time on 2 meters, on 6 meters?
- 2) Staying with the same configuration we were using, on 6 meters, can the packets be lengthened and still see the same throughput, or is shortest possible still best?
- 3) What dB improvement would a change to FSK vice FM AFSK make?
- 4) Are you saying that the PRO's always PROBE full DUX from NETcontrol and then expect to get REPLIES via the SAME path? What application can use this approach in Ham Radio?

5) Still seems that the ONE-WAY position report is an IDEAL application for the statistics of MScat on 6m. Since it is ONE way, AND the POSIT is always the same length (20 bytes, 200 ms) and the meteor dwell time on 6m is longer, SEEMS that shorter packets and higher speeds are NO real advantage compared to the added complexity and cost. So the only thing left is a better modulation scheme. THEREFORE, What is the quantifiable advantage of going to FSK, and unique modems, compared to just playing along at 1200 baud AX.25 FM?

>Bill KE4EER

```

=====

I use the KPC-3 and a Garmin-45 you could be having a cable voltage or connection problem to the TNC. Try this :

- A. Check using Qmodem that you get a NMEA string that start with \$GPRMC
The GPSHEAD \$GPRMC must be all upper case
- B.>UNPROTO APRS VIA KE4EER-5.WIDE (might just be a typo, you want a comma)
- C. Re connect Qmodem and after a few mins and look at LT
The LT buffer should be filled with real GPS data

```

LT
1 $GPGGA,064301.3250.743,N,09645.669,W,1.05,2.6,236.7,M,-24.8,M,,*71
2 $GPRMC,064303,A,3250.742,N,09645.668,W,002.4,121.2,040695,,*06
3
4

```

If not you are not getting data look to the cable.

Reset the LT buffer with null data between tests
by typing it into the TNC using command mode.

Set the BLT to a shorter time for testing.
- D. You do have a ground in the cable I/O some where right ?
- E. What do you have the CD set to: I use Software CD

Let me know if the problem is not getting data into the tnc or out of the tnc.

We use a Magellan & KPC3 also. Only differences in settings I notice are that we use LTP 1 APRS, WIDE rather than GPS, WIDE And also we use

GPSHEAD 1 \$GPGGA (for which we set NMEA in the AUX menu of the GPS to 0183C. If you are using GPSHEAD 1 \$GPRMC then it looks like you should use NMEA 0183B. When I had that part wrong, we got NOTHING out of APRS but the OLD data, it would not update.

Rendered body type: text/plain

6M Packet Radio METSCAT Test - 1995 Perseids
Test Report #8 (final), 14Aug95 23:59UTC

At 96 of 96-hours, all station control, logging and RF functions were still functioning. During 12:00-23:59Z, the W0RPK antenna was directed toward 110-degrees until 19:00Z and then 090-degrees to the end of this test. WA4NTF in EM81er (867-miles) reported receiving a few W0RPK beacon packets in a single burst at 14:42Z. No packets were received at W0RPK from other stations. Beacon transmissions were stopped at 23:59UTC with a final count of 636,880.

Our thanks to test participants and for encouraging comments from

others. Rigorous test analysis will take a few days. Results will be available shortly.

A bit of preliminary analysis shows that during the interval 12Aug 15:20Z to 13Aug 16:30Z (through the 1995 Perseids peak) Jim Roop, KØBI, received 2675 WØRPK beacon packets. During this same interval, including factored out brief intervals when Jim's logging system was down, WØRPK transmitted 144,670 beacon packets. A quick divide (2,675/144,670) shows Jim received 1.85% of WØRPK's transmitted packets.

Test log:

Howdy

Just remember to make your functions in all CAPITAL letters. I didn't think much about it and everything looked like it was supposed to, just not CAPS and so it wouldn't work. When I changed, all worked fine....

Good luck

Q

246. Forget Meteor Scat, BIG TROPO! on 2M

Here in South Florida we did not have any luck with a modest station on 2M Meteor Scatter and I am not surprised, we will be better prepared next year. Starting at about 22:00 EST on Sunday the 13 we started seeing a major Tropo opening from West Palm Beach that extended from SW North Carolina to Key West. On Monday morning I found the whole SE Coast from Charleston SC to Key West lit up on the APRS screen with packets coming in EVERY HOUR since 10pm the previous night.

During Monday while I was at work version 7.2c locked up on me and most everything was lost so I do not know what the band was like during the day but at 7pm the band started looking good again. By 8pm the map was lit from Charleston SC to Key West and who knows where else if APRS was used in all major cities. It is now 23:00 on the 14th and here are the stations I had noted as seen DIRECT from SC.

KE40TB, KD4TXX, WB8DLX, K4HCD, KN4IM-5, KD4MMB, KB5YRZ, and a few others that were lost from the previous night due to the program crash. I have not included ALL of the NE Florida stations that were seen in the Jacksonville/SE Georgia area since let's face it you were all seen! hi hi

This was a great opportunity since all of the GATE's were down as far as I could see and at the beginning of the opening my filter list was set to DIRECT signals only, no digipeated packets. After the bulk of the stations were verified direct I removed the DIRECT filter and was able to have better QSO's with those on. Can any other stations report on terrestrial propagation conditions in their area? We may have lost out on Meteors but between Tropo and probably Hurricane Felix enhanced conditions we saw some wonderful conditions!

6M Packet Radio METSCAT Test - 1995 Perseids
Test Report #8 (final), 14Aug95 23:59UTC

At 96 of 96-hours, all station control, logging and RF functions were still functioning. During 12:00-23:59Z, the W0RPK antenna was directed toward 110-degrees until 19:00Z and then 090-degrees to the end of this test. WA4NTF in EM81er (867-miles) reported receiving a few W0RPK beacon packets in a single burst at 14:42Z. No packets were received at W0RPK from other stations. Beacon transmissions were stopped at 23:59UTC with a final count of 636,880.

Our thanks to test participants and for encouraging comments from others. Rigorous test analysis will take a few days. Results will be available shortly.

A bit of preliminary analysis shows that during the interval 12Aug 15:20Z to 13Aug 16:30Z (through the 1995 Perseids peak) Jim Roop, K0BI, received 2675 W0RPK beacon packets. During this same interval, including factored out brief intervals when Jim's logging system was down, W0RPK transmitted 144,670 beacon packets. A quick divide (2,675/144,670) shows Jim received 1.85% of W0RPK's transmitted packets.

Test log:

14Aug95
1200 W0RPK beacon system at s/n 554195
1442 WA4NTF in EM81er (867-miles) rpts rcvg (2) W0RPK beacons
2359 W0RPK beacon system stopped at s/n 636880

Very interesting statistics - I wanted to participate out here in Utah (Salt Lake City), but family commitments and low power/omni antenna gave me no success on 2M. Can this become a regular test tied to other shower activity? I'm headed for the roof this weekend to reinstall beams!

248. APRS WX ALERT!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 15 Aug 1995 11:58:56 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950815114504.17114A-100000@greatlakes>
Rendered body type: text/plain

Since MScatt is over, we now have a new EVENT on the horizon. With FELIX headed for the mid-atlantic states, hams at the National Hurricane Center have asked if the APRS network can provide real-time WX data. YES!

Here is the plan. TURN ALL THE GATEWAYS BACK ON. FOR EAST COAST STATIONS:

1) VHF (or HF) stations with AUTOMATED U-II weather instruments, change your UNPROTO PATH to go via the GATEWAY onto HF. You will get the APRS "bitch" warning everytime your station transmits, but ignore it. (select CONTROLS-HF to make APRS think you are on HF to silence it).

MORE later as we get going again...

[illegible]

If anyone on this SIG is entering Hurricane FELIX Lat/Lon, please double-check your math. The coordinates are being gathered as decimal degrees from The Weather Channel for example and incorrectly calculated when transferred to APRS format... not a severe degree of error, but an error nonetheless.

Just a friendly reminder. 73 de Boyd AR

> Recorded N3EOY 8/12 at 18:28z four consecutive packets

APR REPLY: Looks like a record to me! (1196 miles) Im holding final release of the oft-repeated status summary until I get ERP's from these stations: WD0GMK, WB5NLJ, K1HTV, N3KMJ, N8AJD, WA4HEI and confirmation of my ERP estimates for some of the others.

My report is only a two dimension packet count only. There is lots more that can be STUDIED from all the raw data. Anyone want to do some detailed analysis of the following?

- 1) Time dimension. Plot number of packets versus local time. Was 0400 to 0800 local time the peak as theory suggests?
- 2) Antenna pointing. Many of the antenna gains are misleading, since this was a random exercise, any pair of stations may NOT have had their maximum gain pointed at the same sky area.
- 3) Part of above, calculate the SYSTEM gain for EACH CONTACT, taking into account range, XMT power, both antenna gains, and the loss due to off-pointing.
etc...

I will NOT have time to do any more of this detail stuff. All the raw data was reported here on the sig, and is available for someone to write an article.. (I assume Stan Horzempa that started all this mess is going to do his usual one page summary....!)

Anyone know of a MScat SIG? elsewhere?

254. kpc3-gps

Well i'm still having problems getting my Magellan NAV-5000DX to work with my KPC3. I think there's is someone on the Sig running this same GPS KPC3 setup, if so i would sure like to know the way it's hookup is handled. I have been at this thing for several weeks now with no luck at all. The problem is that there's no data going into the LT buffer at all. I have tested the GPS and looks like it's working great. Now i fed the GPS data into the KPC3 using Pin#7 for the NMEA- and Pin#2 for the NMEA+. I have used several of the Sig user suggestions as to the KPC3 configurations with no luck at all. By the way i'm using version 6.0 eeprom. A friend of mine uses a Magellan Maridean with a KPC3 and has no problems with his, i even used his configuration. For some reason the KPC3 is not seeing the NMEA data from the serial port. Any help would be appreciated. The Sig is my last resort.

William,

Don't know who told you to put data on pin 7 but it is signal ground. Use pins 2 and 3 and you should be instantly in business. For the KPC-3, the GPS NMEA output should be placed on pin 2 and if you want to try and initialize the GPS with a string from the KPC-3 you should tie the GPS command input to pin 3. However, if you have the GPS outputting NMEA sentences (and I assume you've tested this with just a generic communications program like ProComm) you only need the pin 2 connection and a ground (2 wires, it's hard to miss).

Wishing you success,

Dan Feedback, Ph.D., KJ5MX

256. WHICH LAPTOPS WORK W/APRS-GPS MOBILE?

From: DDOBBINS@aol.com
Date: Wed, 16 Aug 1995 14:29:53 -0400
To: aprssig@tapr.org
Message-ID: <950816142940_76243297@aol.com>
Rendered body type: text/plain

Aloha Y'all de Dave, WH6YC. I do a fair amount of mobile APRS-GPS work in areas I've visited/lived in around the country. My first and best-so-far experiences with mobile APRS have been with my Zeos Contenda subnotebook (386SL25), home built toggler, Garmin GPS, and KPC-3 TNC. My toggler was modeled using Bob/WB4APR's instructions included with APRS. After PacComm introduced their TNCs with GPS support, I bought a Handi-Packet, that neat little cigarette package-size, well-built TNC. I also bought PC's toggling cable, which runs about \$30. Nice little unit, except it never worked with my Zeos laptop. The symptoms disappear, and the unit works, when I either turn off the Handi-Packet, or remove the TNC from the loop. That's when I discovered I could go mobile APRS to do track histories without the TNC and

radio. Not as much fun though, as nobody else sees you moving around. Since mounted the KPC-3, GPS base, 30watt amp and a couple radios (one's never enuf) and a freq counter in a Halliburton briefcase. I call it "transportable", but still want the portable unit with just GPS, Handi-Packet, Radio and laptop for a truly "portable" station to work. When I upgraded my laptop to a Compaq Aero Contura (486SX33) (for \$950 at CostCo) I was hoping the voltage problem, or whatever was causing my true-portable station not to work, would be solved. It wasn't. Same problem as with the Zeos. So, after babbling on here, I have two laptops that don't work with the PacComm TNC and their toggling unit. So, here's my question (finally): Who out there has a similar config using PacComms stuff and has it working with their laptop???? AND what kind of laptop are you using? Bob/APR; and Paul/PacComm have described several poss fixes, including checking voltage that the laptops have in their serial ports with an o-scope. Sri, but I don't have one handy, but will look for some expertise to come up with those numbers. Your turn, and enjoy. Thanks, Dave.

257. NEW LAPTOP SCRUNCHES SCREEN

From: DDOBBINS@aol.com
Date: Wed, 16 Aug 1995 14:35:00 -0400
To: aprssig@tapr.org
Message-ID: <950816143331_76243310@aol.com>
Rendered body type: text/plain

Here's my second msg to the SIG in one day. Wow! Aloha de Dave, WH6YC. My new laptop, a Compaq Contura Aero (color, \$949 CostCo) works just fine, but when I run APRS the screen scrunches about 3/4 inch on top and bottom. Why? Solutions to expand it back to full size? My Zeos Contenda B&W doesn't do this. BTW, the Zeos is for sale. 386SL25, 4MB/80MB, ext disk drive, REAL SMALL and great for mobile APRS/GPS ops. Regards, Dave.

258. Magellan Trailblazer XL, nema output ?

Rendered body type: text/plain

Hello I am new to aprs and have greatly enjoyed watching the map on my , as yet unregistered copy of aprs72. The spots of Felex this AM was a pleasant surprise.

I briefly saw the nema output on a terminal program ,4800 , 8,n,1 ,but now I do not. I read a steady 5 volt on the nema +/- wires, . Shouldn't this output pulse when data is sent?

I removed power and battery's and did a reset, but still no data. I called Magellan and didn't get to talk to anyone nor have I gotten a reply.

I hooked nema + to DB9 pin 2 and have tried nema - on 3 and 7.

Your advice is welcome, Thank You Charles.....

p.s. my mailer destroyed the reply I recieved concerning changing a password and command for removal from list.

Here is the final report of APRS Meteor Scatter packets detected on 2 meters during the Persiads 11 to 15 Aug 1995! If this does NOT accurately reflect your report, then tell me! I still need ERP's for some of the sending stations. This will be the final posting. I will continue to update it as other bits and pieces come in, but will not flood the SIG with it again.

CONCLUSIONS:

- 1) Two meter MScat using 1200 baud AX.25 AFSK FM packets is possible and relatively automatic if a common frequency is used and packets are VERY short (typically containing a gridsquare in the TO field). Miniscule thru-put suggests only application is DX contacts.
- 2) Stations without high power and beams should LISTEN ONLY, and not add QRM to the channel.
- 3) 6 meters is an order of magnitude better, and not only could it be used as the basis for a long distance APRS position reporting, but also low thru-put traffic links could be established.
- 4) Suggest another Nationwide test (but only 24 hours long) during the December meteor shower. By then I will have added a two-way mode for confirming two-way contacts, and better flexibility in transmitter scheduling. Here is the data:

It would be nice if someone made a scatter plot of the number of packets over the 24 hours of local time. There is also another dimension of data that could be gleaned by comparing beam headings on both XMT and rcv and misalignment losses as well as ERP and number of packets...

So we can easily see the players, I am building a MSCATT.BK file that has the locations of all participating stations. It will be posted soon.

Bill, I am having a similar problem with a PACCOM HANDIPACKET and a Magellan Trailblazer XL. I am suspecting a voltage problem that will be cured with a couple of biasing resistors. Bob mentioned this in the GPS.txt file in APRS. I just found the problem late this afternoon. So some time tomorrow GWYN and/or Paul at Paccom can expect a phone call for help. That is if the biasing doesn't correct it.

73 will let you know how it goes

Bob APRS is locking up my computer solid after no activity for about 15 minutes, you asked me to give you the error code, but how can i do that when the system is locked up and only a hard reboot will get it running again?. At first i thought it may be my new 90Mhz Pentium but APRS is the only software that will do it!, and like i said it only does it when there is no keyboard input for an extended period (15 - 20) minutes. I hope there's an answer for this problem.

I know that the Leading Edge laptop, a 386SX machine, at AA4IX does the same thing.
Maybe Bob can find out why. All the other software runs just fine on it in "expanded" LCD mode. My Austin Direct VGA 386SX/33 laptop does not have this malady. My Sharp PC-6220 old 286 notebook runs fine also. Wonder what's going on?

My AUSTIN DIRECT 386/33 notebook has TWO serial ports, no outside box needed. All you do to energize the external 2nd port is to unplug the internal 14.4kb modem which hogs the port if its plug mates with the mainframe from a hardware switch that must be in the modem.

Good computer, VERY BRIGHT MONOCHROME LCD THAT CAN BE SEEN IN THE SUN!

PacComm's plan to move beyond the APRS Port Switch for mobile APRS.

Bob (APR) has been able to get an amazing amount of performance out of what was available in the marketplace. Laptops with one serial port, TNC's with one serial port etc. PacComm's APRS Port Switch is a unit built from APR's readme file so the no-solder set could overcome the single port problem. We (and Bob) have had to make several circuit changes to get the units to work with various combinations of computers and TNCs. In my opinion, the thing has performed quite well considering it was a 'back of the envelope' design. We have looked at using a more positive digital circuit rather than twiddling with bias levels on transistors, but our emphasis has been on moving past the problem, i.e. the 2 serial port PicoPacket.

We have had our problems getting the Pico into production, but if it was easy, there would be more than 4-5 packet manufacturers, right? The Pico with 2 serial ports works as follows. Some of the code features I'm describing are not yet released, but all have been coded and are at least

to the debug stage.

The GPS hooks to one serial port full time. The computer connects to the other serial port full time. When the computer wants GPS output, it asks the TNC for the latest reading and the Pico passes it along.

Capabilities of the Pico 2nd serial port GPS firmware. Field names may change in the production release.

Send an initialization string to the GPS at power on.
Specify and buffer up to four different GPS strings in Pico memory.
Dump any of these buffered NMEA strings to the computer when commanded.
Beacon one or more of the buffered strings to an UNPROTO address which is different than the BEACON address.
Accept four alias callsigns. MYALIAS, MY1ALIAS, MY2ALIAS, MY3ALIAS.
Capture GPS output strings (selectable) into PMS messages for later download. Strings to be included, timing (frequency of storage of data string) and number of entries in each message to be specified.
A method to switch the Pico function between being a 'tracker' and attaching to an APRS computer, e.g. if you unplug the computer it automatically goes into tracker function if it is enabled.
Some flexible methods to download the PMS position history logs. Will do autoforward to a BBS, or you can connect to the PMS and read the HST messages, or there will be a method for UI polling and perhaps a timed transmission.
Not on the final list yet: Ability to hook a GPS and a weather station or other device to the Pico at the same time, i.e. the computer port and the 2nd serial port will both be in GPS (or telemetry) mode and no computer is supported. So as a 'tracker' you can tell where your boat is, and also the weather conditions.
Obviously the HST function can be used with a weather station instead of with a GPS. So you can capture wx readings each n minutes and download the history some time later.
Not sure if I remembered it all, but at least you can see that there will be no need for a hardware port switch.

In the mean time, I'm happy to take tech support mail about the APRS port switch either on this forum or privately as you deem appropriate.

>Who out their has a similar config using PacComms stuff and has it >working
with their laptop????? AND what kind of laptop are you using?

>
My .02 worth

Ive set up several systems with the PAC-COM GPS/TNC interface and here is what I've found.

Works:

Pac-Com Tiny2 with GridPad M-1910 and external keyboard (8088)
" Toshiba T-1100+ (8086)
" Compac LTE (8086)
" Zenith Supersport (80286)
" Gateway (80486)

I have also played around with many "clone" desk tops and they all worked with the interface and Pac-Com TNCs, but change to another TNC and you get no data on GPS line, even when the pins are right. Thinking that maybe its the DB9 to DB25 plug (Pac-Com uses a DB9 for serial input, most other TNCs use a DB25) I made up a connector to pass data, still no go.

I suspect that the PacCom interface likes the PacCom TNCs only. When I set up a system for someone and they need everything I tell them to go with PacCom, if the have an MFJ, KPC-3 or other taper clone we build Bob's

interface. If its an AEA product I run, <GRIN>, by the way anyone on SIG have any experience with the AEA splitter?

Here is something of interest for all of you DGPS fans.
Marvin - WB6PKK

Subject: OTC 08/10 0948 NEW RTK FM BROADCAST SERVICE LAUNCHED

OTC 08/10 0948 NEW RTK FM BROADCAST SERVICE LAUNCHED

SANTA CLARA, Calif., Aug. 10 /PRNewswire/ -- ACCQPOINT Communications Corp. today announced that the company will activate its new high-precision DGPS service on Sept. 30, 1995. The new service called RTK FM(TM) will deliver decimeter accuracies in the top 40 markets in North America and Asia. RTK FM(TM) broadcasts in the Trimble CMR2 format as well as a RTCM format.

For more than two years, ACCQPOINT has been offering real-time DGPS with a 1 meter accuracy over the FM subcarrier paging network of some 500 FM stations operated by CUE Network Corp., ACCQPOINT's parent. The network covers over 95 percent of the population of Canada and the United States. Today, the 1 meter service is provided in over 150 markets in North America.

Gordon Kaiser, chairman and chief executive officer of ACCQPOINT, stated, "RTK FM(TM) is a major innovation in real-time Differential GPS service. For the first time, RTK data is available on a public subscription basis."

The RTK FM(TM) service uses a proprietary subcarrier technology to broadcast carrier phase data over the 67 kHz subcarrier at 9600 bps.

ACCQPOINT also announced a new Affiliate Program which provides that an exclusive marketing partner will be appointed in each market where the RTK FM(TM) service is offered. Affiliates will also market the company's existing 1 meter service on a nonexclusive basis.

Kaiser added, "We believe it is important to offer a complete range of products. RTK FM(TM) is targeted specifically for the survey market. While the 1 meter service meets the requirements of the GIS market at low prices, there is a growing need for higher accuracies and this service meets a real gap in the marketplace."

In addition to DGPS, the CUE network is used to provide nationwide and regional messaging throughout North America to over 120,000 subscribers. The company's nationwide messaging services are distributed by leading telephone companies such as AT&T Wireless, Bell South (MobileComm), Cincinnati Bell and MetroMedia.

CUE also uses FM subcarrier to distribute real-time, route-specific traffic information. On April 14, 1994, CUE, in conjunction with TRW, was awarded a grant from the Federal Highway Administration to install a system to distribute real-time traffic information between San Francisco and Reno, Nevada. The TrafficAlert service is also provided in

conjunction with "GeoFinder for Windows," a digital map product recently introduced by Thomas Bros. Maps of Irvine, Calif.

Through CUE Southeast Asia (CSEA), a joint venture based in Singapore, CUE is establishing both international paging and DGPS services in Singapore, Thailand, Indonesia, Malaysia and The Philippines. CSEA was awarded the first license in Asia to provide commercial DGPS services in February. CSEA is a joint venture between CUE and the National Trade Union Congress (NTUC), a federation of trade unions in Singapore. NTUC operates Radio Heart, Singapore's first private radio station, in addition to a fleet of over 7,500 taxis, the country's largest insurance company and the largest supermarket chain in the country.

269. Extra serial ports

From: kc5ejk@onramp.net (Robert Winingham)
Date: Thu, 17 Aug 1995 11:06:07 -0500
To: aprssig@tapr.org
Message-ID: <v01520d02ac59185c6c2c@[199.1.11.122]>
Rendered body type: text/plain

Extra serial port for mobile computer GPS/APRS users.

I have a solution to the problem of only having one serial port.
This will work for both IBM and Macintosh portable computers

If your computer can use a PCMCIA card or you can add a
PCMCIA adapter to your system read on:

SOCKET Communications makes a PCMCIA type II Serial I/O adapter
that uses a high speed UART16550 230 Kbps

I ordered the unit from the PC side of MAC-ZONE (PC-ZONE)
Part number P19936 Socket PCMCIA Serial I/O adapter cost \$135.98

Now we can forget the push button and strange HST Cable and
have both a GPS and APRS TNC port. Just get two units and also
connect your weather or what ever.

Note to Mac users:
The PCMCIA serial card works fine with MacAPRS and any other
communications aware communications program. I just shoved the card
in and the Communications tool box saw it as a "serial tool" device
called "Lower Card Slot" .
(I used the lower slot - there is room for two cards)

Note to Dos/Windows users.
The PC disk included with the unit has direct enablers so after reading the
45 page installation booklet you will have Plug-and-Pray also.

I did not ask about the OEM versions that have TTL I/O, dual-port or
extra power output to drive a peripheral.

They also have a GPS PCMCIA card that uses the Trimble TSIP protocol.
I only saw this at "Mobile World" and have not used it.

Rendered body type: text/plain

>I hooked nema + to DB9 pin 2 and have tried nema - on 3 and 7.
=====

There have been several posts about the Magellan Trailblazer
NMEA + and NMEA - and which wire goes to what. Someone with this unit
needs to speak up. Then we can add it to the GPS interface FAQ.

My Garmin-45 unit has the two wires used as send and receive but you need
to use the power ground wire as the data ground.

I don't think you are to use Nmea- as ground.

A true RS-422 will have a rec+ and a rec- and a xmit+ and a xmit-

This is the way a Mac serial port works.

A Mac RS-232 cable just has a ground jumper to the rec+ and uses the rec- as "Good old" RS-232 pin 3. RS-232 pin 2 is the xmit-. The xmit+ is left floating.

That ground jumper inside most Mac RS-232 cables is why Mac GPS users need to use a direct cable to the round 8 pin din socket.

Rendered body type: text/plain

I'd point out here that most of the smaller GPS products, even those using DGPS capable receivers, are not RTK-capable.

RTK is a fine-precision (sub-meter) protocol that is encompassed in the RTCM SC-104 protocols, but is not one of the standard Type-1 or Type-2 sentences most handhelds and less expensive receivers will deal with.

Hello Bob,

My name is Tom and I am using a shareware version of aprs72b which I downloaded off a local bbs. I am sending you this message for myself and 2 others, one who is registered (KK4BZ). We are all having problems getting the mouse to work with the program. On my computer which is IBM pc compatible 386sx-16 with 2 com ports. I have my tnc on com2 and I'm selecting com1 for the mouse. When I get into the program I am getting erratic behavior such as the Zoom window and the slightest movement of the mouse and all kinds of maps come up when not selected. I have a Logitech mouse series 9. It is installed in com port 1. Do you have any suggestions as how to correct this. By the way Carl KK4BZ asked me to send this message because he has no access to the Internet and thought this would be the faster route. Thanking you in advance.

 Rendered body type: text/plain

I recently saw a sig message about possible APRS frequencies for 6 meters
 does someone have the suggestions. I have lost the message and am waiting
 for a 110W commercial EPROM programable radio to be delivered. If I can
 get the frequencies I will have them burned into the EPROM before I take
 delivery. I have about 2-3 open slots (36 CH radio) left after all the
 local repeaters, simplex, and confirmed DX repeaters are added to the list.
 If I get the frequencies quickly (tonight or Friday) I may be on 6M APRS
 by next weekend.

I called Magellan yesterday concerning the GPS-2000, the unit DOES NOT have
 a NMEA port. I immediately thanked them and hung up!

Dave-

Dontcha at least have a meter? Ck voltage on pin 6 of the laptop's 9 pin serial port with respect to ground. I can't remember if pin 7 is ground on the 9 pin, so better ck that.

Paccomm's circuit needs that voltage to work. Their later cables jumper pin 6 on that port to pin 6 on the TNC connector so you can grab voltage either place. However that will not work either, with a KPC3

I have exactly the same setup, and this is what I did.

Add a wire from the paccomm circuit board in their switcher. It goes from the place that is currently connected to pin 6 on the laptop over to pin 25 on the KPC3. Make the mod in the KPC 3 that allows powering the tnc from pin 25. Power the TNC normally. Pin 25 will now SUPPLY power to the paccom board for you.

I know this works. My ammo-box portable is wired this way. Boy do I get stares when carrying it on the planes!

Probably the same problem as Dave. The switchen needs power to run! Get power to pin 6 of the laptop connector. The Paccomm switcher will work just fine. I don't really think bias levels or gps data levels are your problem.

I noticed a new Magellan for sale: the 2000. It is 199.95 at West Marine. Looks like it was meant to be a "Garmin GPS 40 Killer". Sorry, Magellan-next time put NMEA on it!

I talked to Magellan engineers today- no NMEA! They do have another low cost one in development. It will have NMEA and will be cheap as well. They still plan to use a dtrange proprietary data connector though

My portable tracker looks like an old police call box and with the rubber duck test antenna sticking out, like a road side call box. I got the black plastic case at "The Container Store"

We need to get some GIF picture files of the different tracker designs posted for the APRSSIG users to see.

I had some good results using the tracker and APRS at the Solar Car race in Dallas a few weeks ago. I am a bit behind in posting the results and tracking data to the APRSSIG.

Rendered body type: text/plain

Hello;

I talked to Magellan today. Here is there recomendation for connecting the gps unit to a pc, DB-9 connector using the optional data cable.

orange wire nmea (+) to DB-9 pin # 2
brown wire nmea (-) to DB-9 pin # 5

If you wish to make your own data cable for the 6 pin connector on the back of the trailblazer...

With the gps unit upright the top pin is # 1, the bottom pin is # 6.

The nmea (+) is pin # 2 (referred to as orange above)
The nmea (-) is pin #5 (referred to as brown above)

I tried mine with a PCjr, Compact lite notebook, and Pentium-90 and still got no data. Magellaqn suggested I send the unit in for warrenty service. Expected turn around time 7 to 14 days

Aprs72 registration is in the mail !

>See my posting about how to add an extra one or two serial ports
>to a laptop that can use PCMCIA cards. It looks like the future
>Macintosh and PC portable's will have built in PCMCIA slots.

The Macintosh Powerbook 520/520c/540/540c all have two battery slots, one of which can be sacrificed for a PCMCIA (PC Card) adapter. The adapter will allow the use of two type II or one type III cards. I am told there are devices out there which when plugged in to the PCMCIA slot turn it into an additional serial port, but I have been unable to find a Mac compatible one yet. Additionally that route would be expensive, the adapter originally retailed for ~\$200 (no idea of current prices), and the PCMCIA card must be a couple hundred more ... I am ordering a Pico w/ second serial port which will be a much cheaper solution and just as effective.

Saw one at Boater's World the other day. No NMEA output. Simplistic display. A little cruder than the Garmin 40 or 45. Probably well worth the extra cent buck for the Garmin (probably 45 over 40).

Bill, I have corrected the same problem in my setup with a quick phone call to Paccom, actually after my discussion with them I don't know why I didn't see the problem on my own. Like you I had the NEMA + wired to Pin 2 and NEMA to Pin 5 on the DB-9. This is correct since I want the gps to talk to the computer most of the time and this configures the GPS as a modem to the computer. So since the GPS and TNC are both modem type devices you have to use a null modem adapter to get them to talk to each other. In essence all the adapter does is switch pin 2 and 3 around on each end. That being the case I opened the DB-9 case at the computer end of the NEMA cable and Installed a SPDT switch. Center (wiper) pin of the switch to NEMA + and the other 2 poles of the switch to pins 2 and 3 , respectively, of the DB-9.

```
                /-----o PIN 2  
NMEA + -----/-----o PIN 3   OF DB-9
```

By doing this I can now hook the GPS up to either the HSP cable I made or staight to the back of the TNC, and i flip the switch to the correct pin.

Rendered body type: text/plain

Moyers reminded us all of the OBVIOUS first mistake MOST of us have made
with the PacComm HSP adapter. Remember the HSP switch is a Y type of
device that allows both the GPS and TNC to send data INTO the PC.

====

Unfortunately because of similar sex DB-9's, when you decide to go
STAND-ALONE-TRACKER it appears that you can just unplug the GPS from the
adapter and just plug it into the TNC. WRONG!

You gotta swap pins 2 and 3...

You see, PacComm assumed you would have the GPS DB-9 wired to match
your PC. So when you insert the HSP circuit in the middle, there
is no change. But that was before Stand-alone-trackers.

Now with the GPS usually being connected either to the HSP or TNC
and rarely into the PC, you might consider wiring the GPS to match the
TNC connector and reversing the pins on the HSP pigtail. Then you can go

between HSP and Stand alone tracker just by moving the GPS cable. But then you have to remember to swap 2 and 3 with a null modem cable when ever you wanna plug the GPS directly into the PC. SO there you have it. YOu can have 2 out of 3, but never have all three match in any configuration...

On START UP, this always means your VIDEO card is not standard VGA, CGA
or EGA. Ie, a hercules or some other non-standard video mode...

299. KPC3 problem

From: wnolle@ro.com (William Nolle)
Date: Fri, 18 Aug 1995 00:53:45
To: aprssig@tapr.org
Message-ID: <199508180601.BAA26190@sh1.ro.com>
Rendered body type: text/plain

Well to keep you posted on my GPS to KPC3 problem.
I contacted Kantronics several times and they don't have a clue as to
my problem, So i called Magellan and guess what (Right not a clue)!.
If there is anyone on the Sig that is running a Magellan NAV5000DX to a
KPC3 i would sure like to hear from you. I even wen't out and Bought another
one of those stupid KPC3's figuring there may have been something wrong
with it according to the Kantronics Tech support ;-) and it doesn't work with
that one either. So i'm lost folks.Here is my latest.

I checked the Magellan's output voltage and it's 2.1 volts!
I hooked it to a terminal program and it puts out all the NMEA strings!

I hook the NMEA + to Pin2 of the KPC3 DB25 connector!
I hook the NMEA - to pin7 of the KPC3 DB25 connector!

Now i set my KPC3 as follows:

```
BLT 1 EVERY 00:00:30

```

Simple setup so why don't i see any data in the LT buffer?.

Like i said sure would like to contact someone running a Magellan NAV5000DX to a KPC3. I have at one time run this setup to a Paccomm Tiny-2 and it worked. But now i have build this compact realy nice looking portable tracker using a KPC3 and it won't work. I hate to have to rebuild the whole setup using a Paccomm Tiny-2 if i don't have to. Everyone both at Kantronics and Magellan tell me it should work (But it doesn't).

Any help to get me tracking would be appreciated!.

page 2 of the KPC-3 GPS addendum may offer a clue.

1. Some vendors use TTL levels +5 to 0
2. Some use inverted (true TTL)
3. You may need a TTL-to-RS-232 line driver

Was the 2.1 V, when data was being sent ??
Do see what the peak is with a scope.
Could be a low supply voltage to the Magellan NAV5000DX

I had to use a line driver to make the Garmin-45 drive a RS-232 Mac cable.
(But if I had tried a RS-422 direct cable it would have worked)

A line drive is no big deal there have been 4 circuit designs posted here.

1. Op-amp (but it needs +- 15 Volts) Radio shack part
2. RS-232 line driver (but it needs +- 15 Volts)
Radio shack part 276-2520
3. MAX-232 RS-232 line driver (5 volts only)
but needs a few caps for a voltage pump (makes its own +-)
4. MAX-233 The new MAX chip needs almost no support parts and

runs on 5 volts.
Dallas semiconductor has a replacement for both MAX chips.
TSC232 and SP233

I cheated and used my Icom radio CT-17 communications interface level converter box for testing as a TTL to RS-232 as it uses a max-232 chip. If your TTL level is inverted you will need to run the signal through the chip twice or use a hex inverter.

You problem could be only a weak signal that needs a little boost. I have two KPC-3 and like them.

Don't forget to set CD to software, if you use a radio to xmit the gps data, a high level of RF noise can keep the tnc from transmitting. I do wish the TNC had a state-machine like my PK-96.

Well said, Professor Bob.

I have a small Rad Shack 9-pin to 9-pin null modem adaptor that I use just for that purpose.

Did you try the two resistors mentioned in my DOCS? NMEA is NOT RS-232 compatible necessarily. I don't think the Magellan NMEA has any negative voltage swing, so the two resistors that I always use provide a little negative bias. Yes, it works as is with your PC, because that particular PC just happens to not care too much about the negative transistions, but the TNC serial port looks like it does require it...

Lemme know if that helps (look in my GPS.txt).

>Simple setup so why don't i see any data in the LT buffer?.

>
as I see the above set up of the KPC3 I notice that you have PBBS 0
the lt buffer is in the PBBS
so you need it set to at least 5
also you have to specify what you want it to save
read page four of kpc-3 manual addendum for kpc3
you must also set
LTRACK 5 LT1
to save 5k of LT1 tracks....
to see these you must connect to the pbbs
and download them with the ltr command
P.S. do not use sysop mode from remote to read the LT buffer.
Hope this fixes your problem

You really need to look at the GPS output with a scope. The data out should swing from at least +3v to at least -3v for many serial ports to recognize it. I know there are exceptions, since many PC ports will accept a 0v to +5v swing. Many Macs won't. The KPC may or may not, I don't have one to test. But since you can see data with a PC, I suspect this may be an explanation. Getting around it depends on whether its the absolute voltage or the polarity swing that may be affecting you. My \$.02... Good luck

309. IRC CHAT CHANNEL

From: lbutler@awod.com (Larry Butler)
Date: Fri, 18 Aug 1995 14:59:02 -0400
To: aprssig@tapr.org
Message-ID: <199508181859.OAA12329@sumter.awod.com>
Rendered body type: text/plain

I finally got my IRC chat mode up and running and had a lot of activity last night on a channel I created on cs-pub.bu.edu called #hamradio. At least I think I started something as it wasn't on the list of channels I got back, one never knows...(sigh). Anyways, we had worldwide coverage from as far away as VK4EII and some Europeans. There was quite a bit of ham interest about APRS as they have all been seeing APRS in the tnc ads but have not experienced it. They seemed mostly afraid of either looking stupid on the air or not knowing where the software could be obtained. I told them about ftp.tapr.org. I put a bln1 on the HF APRS and had a few connects from that! Why do I not see and APRS channel on IRC? There were a lot of "silent watchers" checking into #hamradio, some with calls, some not. They all had broken typing fingers as we never saw a word from them. I suspect my conversations with the guys might have given more hams and non-hams ideas. I told one guy, who has a scanner and tnc, to download APRS then use his scanner on 145.79. We have a lot of "non-ham users" on APRS here in Charleston with scanners tuned to my WIDE. I met one at RadioShack just today!

Well, I propose that we all get together for coffee and non-fat donuts on #hamradio around 00Z until if you have time. Lots of guys had trouble staying connected from other IRC providers, I only lost my link once. It seemed MUCH better if you use cs-pub.bu.edu directly to the #hamradio channel. The bots were jumping in and out something fierce trying to stay connected from elsewhere. Hope to see the aprssig guys on the channel later...73, Larry KN4IM/GATE/WIDE Your LowCountry APRS connection.

I mainly use Undernet, which is more reliable, has better protocol (tired of
getting dumped? nickcollided? channel takeovers?), etc, etc.

If you'd like more info, try server undernet.org (which will get you to a
random server), and then track me down (HoopyCat) :-)

IRC is a really neat way to get tech support, and all that other neat stuff.
Enjoy :-)

To: aprssig@tapr.org
Subject: [APRSSIG:2862] Magellan Trailblazer XL

Hello;

I talked to Magellan today. Here is there recomendation for connecting the gps unit to a pc, DB-9 connector using the optional data cable.

orange wire nmea (+) to DB-9 pin # 2
brown wire nmea (-) to DB-9 pin # 5

If you wish to make your own data cable for the 6 pin connector on the back of the trailblazer...

With the gps unit upright the top pin is # 1, the bottom pin is # 6.

** this line incorrect** The nmea (+) is pin # 2 (referred to as orange above)
The nmea (-) is pin #5 (referred to as brown above)

The correct pins for the Magellan 6 pin plug are as follows.
pin # 3 is NMEA +
pin # 5 is NMEA -

Sorry for the mistake....c wd

Today i tracked Ralph N4NEQ-9 on his way to the Huntsville hamfest from Atlanta, this was the most spectacular site i have seen on APRS so far and i have been using it for a long time. I tracked him and we where keyboarding at the same time, but to follow him and look at it with the 3D function over very detailed 1:100,000 maps is something to behold!. The best part was the actual landing. I have a detailed map of the airport and could actually see him land and taxi down the runway. I took a guess at his altitude at one point and was only off by 50 or so feet. By the way also tracked him right trough town right to the Hilton parking lot (In his car of course hi). Knowing Ralph it's a wonder he didn't drive the plane trough town.

HAVE A NICE DAY YA'll...

I just got the data format today and if I get the conversion porgram working I am going to try to re send balloon data in APRS format on 145.790 in the Dallas Area. I don't know if out Dallas HF gateway will be working

but several states in the South should get the balloon packet.

Bob kc5ejk@onramp.net

BALLOON LAUNCH ANNOUNCEMENT
THE NORTH TEXAS BALLOON PROJECT, MISSION # 7

The North Texas balloon project will launch its seventh high altitude balloon experiment carrying amateur radio payloads on the 19th of August, 1995. The payload carries a variety of radios and instruments that can be easily used by any amateur with a Technician's license or above.

The launch will be from Clifton, Texas (located 30 miles west of Hillsboro) at approximately 9:30 AM. In the event of inclement weather, the launch will be delayed to the next day, and then to the next Saturday (the 26th). There will be a pre-launch net at 8:30 PM on the Ft.Worth 146.76 repeater the evening before the launch. The morning of launch there will be an HF net on 7.155 MHz +/- QRM. The Net control station will probably be W5IU.

Approximately two hours after launch, the balloon is expected to reach an altitude of 95,000 feet before burst. At this altitude the area of visibility will be about 370 miles in any direction for a total 740 mile communications range. In past missions, there have been QSO's between Corpus Christi, TX and Salina, Kansas.

The following is a list of the available experiments onboard:

Two Crossband FM Voice Repeaters:

There will be two crossband FM repeaters open to all.
Uplink #1 147.450 MHz Downlink #1 445.850 MHz
Uplink #2 147.570 MHz Downlink #2 445.970 MHz

Packet Telemetry on 144.290 MHz:

This GPS and telemetry information will be the data downlink (downlink ONLY) of the mission. The packet format is the common 1200 baud AFSK found in all TNC's. The data will be presented in an easy to read format with no conversions required and is NOT in APRS format. Packet digipeating and packet connects to the package will NOT be possible.

GPS:

Precise longitude, latitude and altitude data will be provided by a donated Rockwell NavCore V GPS receiver. The following data will be measured and can be seen on the 144.290 MHz packet downlink:

* UTC day and time	* Longitude	* Latitude
* Altitude	* Bearing	* Ground Velocity
* Velocity up		

Telemetry:

There will be an onboard 12 bit, 8 channel Analog to Digital converter. Six of the eight channels are used to measure the following:

* Inside Temperature	* Outside Temperature
* Barometric Altitude	* Main Battery Voltage
* ATV Battery Voltage	* Summed Battery Voltage

Amateur Television (ATV)

There will be a live, full motion, Amateur Television camera and 10 Watt transmitter onboard. The downlink frequency will be 439.250 MHz VERTICALLY Polarized. This frequency was chosen to exactly correspond to Cable channel # 60. With a 440 MHz beam and reasonable Low Noise Amplifier, a cable ready TV tuned to Cable channel 60 should be able to receive an acceptable signal. The camera will be remotely pointed via ground command to any of 256 possible positions.

Other Innovations On NTBP #7

Active package stabilization:

....Remotely controlled air foils to cancel package spin.

Power distribution:

....Non essential equipment turned off after touchdown and batteries summed to provide power to essential DF'ing beacons.

Audio Distribution

....Ground commands allow audio from crossband repeaters, packet

downlink, or command uplink to be piped through ATV audio.
Improved Parachute/Tow line
....New spreader ring design, swivels and woven tow line should help
ensure that parachute does not tangle.

QSL's can be had through KG50A via the Callbook address.

Hello Group:

I'm just getting started with aprs and am interested to learn how one obtains or creates maps for the area of interest. I live on the California coastline and would like to begin by utilizing maps of this general area. Is there a text available, or perhaps a .doc file somewhere that can introduce me to this topic ? Thanks very much.....Jim K6OYY

Hello I saw your message and am just about to take a trip back north and would really like to run APRS with a notebook on the way. I have everything else but my old notebook has a pair of dead batteries that cost \$125 each! and the DC adapter is no longer made. I have little time to make my decision so any prompt words of wisdom would be appreciated! I really hate spending the \$\$ now but since I do not plan a trip this long anytime soon I guess the smart thing would be to buy it now instead of 2 months from now AFTER the trip.

I will include BOTH frequencies in my UNIDEN trunk mount "power monster".
I have had my friend hold up on the EPROM so I will not be up on 6m till'
after the wedding trip.
Have figured that my ETA to NJ is 1 day earlier than my reservations so I
plan to "kill some time" in your area. If you are available on the 26th
let me know either here or u can call (407) 745-2404 after 5pm weekdays.
Weekends call whenever you like, I'll always be happy to hear from you no
matter what time it is. If you are not ava. on the 26 I will try to make
it to the Goddard SFC for a tour and try to meet with you on the 4th or
5th. Planing to stay in Arlington on the way back for 2 days of visiting
DC. What repeaters do you suggest in your area ? I may have a laptop for
the APRS trip, going to Costco and may take the plunge for one of the
Compaq AERO Color jobs. Wife will be happy when she can get the 486/66
back from APRS work!

I have had requests from a few people to support the Heathkit 5001 weather station. The people that requested this were nice enough to also supply enough documentation to enable me to start writing the code for this unit.

This code is being written for MacAPRS, and should be in beta-test within a couple weeks. Unfortunately, I do not have a Heathkit station..

Is there anyone out there that has one of these that would be able to either loan it to me for a while or would be willing to sell it cheap??

The reason I can't borrow the ones from the people that want this is that their units are in constant use..

Rendered body type: text/plain

Since most stores will NOT let you load any software on to a PC in the store for fear of virusus, here is all you need to do to test ANY PC for APRS. Since QBasic comes with DOS since 5.0, the PC should have it. Run this program.

```
SCREEN 9
LINE (1,1)-(639,349),14,B
```

That will draw a box around the edge of the APRS screen area. That is the size of the APRS map. If you are not happy with the size and shape of the box, then move to another laptop.

By the way, after you enter that BASIC program, to run it, just hit F5.

Hello and have a great day! :-)

Cleaning out my computer room and have some "goodies" for sale:

TOSHIBA T1200 HD laptop. 8086 processor, 20 mb hard drive, 3.5" floppy, modem, power supply and manuals. The battery is suspect..don't know it's conditon. This is a great packet/portable rig.. It works on 12VDC, just plug it into your auto and go.

Note: Have used this on APRS and it works GREAT!!

Price \$ 295.00 offer/trade

KAYPRO 2000 laptop: 8086 processor, (1) 3.5" floppy. Big LCD screen. Power supply. Works good, but I think the battery is bad!
Works on packet, but haven't tried it on APRS!

Price \$ 95.00 offer/trade

COMPAQ suitcase type portable: 286-8mhz. Complete unit with built in CRT. Manuals. This unit is very good and has been in use until today!

Price \$ 195.00 offer/trade

Call me at (916) 899-1835

Anyone out there that would like to share the hookup and the software setting for GPS to Paccomm Handypacket and Tiny-2 (think they are both the same hookup). I have received some great advice and help from the sig, but still no GPS-APRS tracker on the air. The moral of my story DON'T think of using a KPC3 for a GPS only tracker if your planning to use a Magellan NAV5000DX because you will not get any help from either Kantronics or Magellan even though Kantronics states it will work with GPS. I have used the NAV5000DX at one time with my Paccomm Tiny-2 so i know it will work, i just don't remember the setup or wiring hookup. I didn't want to do this because i have to rework my metal case that houses all this but i should have checked this before starting i guess Hi. Recently i have started to printout all the good information that passes through the Sig so in the future i will not have to keep asking over and over, and at 62 years old the memory is not what it used to be believe me. Again thanks guys for all the help.

Rendered body type: text/plain

This is to let other mobile or prospective mobile APRS users know of a combo that is just not quite right for "out of the box" mobile operations.

Under the disguise of a wedding present for the YL I purchased a Toshiba T2105 486DX2/50 laptop at Office Depot last night. Nice computer except for no 12V in (bought small power inverter and AC transformer is built in) and there is a bit of monitor scruntch with APRS.

Got APRS to work well with the GPS plugged into the Serial Port but as soon as I connected the PacComm HSP cable all I could access is the TNC (a PacComm Handypacket) and could not get any NEMA data (yes HSP was configured).

I know a bunch of users are having this problem and I have saved a few of the messages so I am going to try to access them so I can print them out. Seems that when I EXPORT my SIG messages in this UNIX based system to the BBS's directory set aside for me some of the files (messages) just do not want to download. In case I cannot get the older saved messages can

someone send me the fix as a private message ? I know that the fix dealt with pin #6 and a jumper to the TNC or was it the serial port for voltage supply.

Hello Group:

I'm considering Garmin's low-profile mag mount GPS antenna for use with my GPS45.....I would value some comments regarding this or other antennas for vehicular use.....curious to know what others are using out there. Thanks very much. Jim K60YY

I am using the Garman car antenna and it works FB all the way.

The ant. has a built in amp and feed with RG 174 coax.

Hello John: Thanks for your response.....glad to hear you've had good success with the Garmin vehicular antenna.....I didn't realize it was an active antenna, are you using it with a Garmin GPS45 receiver or another do you have another model ? Jim, K60YY

I have used my Garmin GPS-50 antenna remotely mounted with a homemade mag-mount and about 8ft of cable.
For the price of the mobile antenna from Garmin I would be worried about cable breaks since it will probably go thru the window or get shut on the door. My XYL always forgets that it is thru the window and opens the door prior to moving the antenna back in. And when I put the cable thru the door I crindge at the smashing, but then again it cost nothing so it is not a big deal.
Take a old CB/Cellular magmount that uses a screw to attach the antenna to the magnet (very common mount) and bend a piece of metal into a L shape. The "L" will be bolted with the short side down and then by drilling a hole in the vertical part you can insert a bulkhead BNC FEMALE-FEMALE, The Garmin antenna will mount on one side (SECURE WITH TAPE!!) and then a BNC jumper to the other side towards the GPS.
REMEMBER to check the cable for shorts before using there is +5 v. at the antenna cable!!!
I have used mine for over a year and it works great! Instead of having a wire in the way all the time I have taken it and mounted it under the trim of my car from the front window pillar down to the dash and then underneath to where my GPS-50 is mounted on a cellular pedestal. It helps to be in the cellular business, lot's of junk to put to good use.
Whenever I go in another car I take along a extra BNC/BNC cable and can use it wherever I like and the other cable stays put.
Good luck and save your \$180 or so for one of those great Pico Packet TNC's got one on my hit list as soon as I recover from this Color Notebook I bought for APRS!

Some of you may have not noticed the F8 command which has been in recent versions which lets you get an INSTANT fix of your current location in HSP mode. This was added for Fox Hunting where you need to get a GPS posit at the same time you see a good fix on the doppler...

The F8 key has another very useful function, and that is marking intersections, checkpoints and other landmarks while driving and building a track history. Remember that you can replay any APRS track history into MAPFIX and draw a map of anywhere you have driven... With F8, now

you can be sure of having a dot right where you wanted one for making the map.

Here is how to use F8 while driving to help you later build maps:

- 1) Set HSP-POSRATE to something like every 5 to 15 seconds or so. This is so you get a steady stream of dots.
- 2) Everytime you want to mark an intersection or checkpoint or other feature for your event, press F8 to instantly update your GPS position.
- 3) Then press GO to bring the cursor to that location, and press INPUT-ADD to add an OBJECT to your POSIT file giving it the name of the location you want to remember. The INPUT-ADD command will ask you for the name of the object.
- 4) Alternatively, to avoid having to type in the name (while driving), you can just hit the INPUT-SAVE command, and a serial numbered object will be added to the position list. If you can remember what these sequential OBJECTS are, then unique names are not necessary. Usually it is easy to remember these marks, since you probably already have a paper map for the special event for reference.

Unfortunately, when you replay the track history file back in MAPFIX, all the dots look the same, but at least if you used F8, one of them will correspond to each marked location. Later after you have integrated the map into APRS, then you can do a real REPLAY of the file, and these special checkpoints or marked locations WILL show up to verify the quality of the map...

An ALTERNATIVE to step 1 and 2 above, is to set your POSRATE to 10 minutes, so that NO points go into the track history, EXCEPT for each time you press F8. This gives you total control over what dots will be overlayed in MAPFIX. In effect you are using your CAR AS A MOUSE in the real world and using F8 to "click" on each turn in the road! The down side is that this method demands a LOT of driver concentration. The UP side is that EVERY POINT was selected by you and all you need to do in MAPFIX is connect the dots!

In my opinion, if the map is big and you are doing a lot of driving, then the automatic high 5 to 15 sec rate will allow you to think about other things while driving without fear of missing a slight turn. You can still mark any point with the F8, but the problems are figuring which dot is which when you go to build the map... So in addition to just marking an intersection, you should also be sure to eventually drive through the same intersection on the other road to clearly show where the road is.

341. KPC3 for a GPS only tracker

>>The moral of my story DON'T think of
>using a KPC3 for a GPS only tracker if your planning to use a Magellan
>NAV5000DX because you will not get any help from either Kantronics or
>Magellan even though Kantronics states it will work with GPS.

Here is what I would do to prove it is not a voltage level problem.

Feed the NMEA+ and NMEA- into a ICOM CT-17 at the CI-V remote input J4 plug and get the RS-232 output at the J2 RS-232 plug. Use only the output signal RS-232 Pin-2 (I think) and RS-232 pin 7 ground.

RS-232 is -5 to -15 Volts when just sitting there and it other state is +5 to + 15 volt.

This negative voltage makes it easy to find the Data output pin on RS-232 cables (pin 2 or pin 3)

Feed this RS-232 into your computer using a communications program. If you get data but it looks garbled then the TTL input signal is inverted and you need the reverse it.

I don't think you can just swap the input wires due to the possibility of a common ground. (It might work ?)
But the correct way is to breadboard a quick test circuit

using a Radio Shack HEX inverter chip to invert the TTL input signal.

(You could use the other gates in the MAX chip to invert it but why mess up your ICOM computer interface CT-17 device).

If this works with your computer then you can use this TRUE RS-232 signal to drive the KPC-3 from your GPS.

Doing this will help remove one of the biggest gray areas of you problem.

=====

You also could open the KPC-3 and monitor the voltage on (Pin 10 of U2E)) the Schmitt trigger gate after the 100K ohm resistor which is the TXD input of the TNC.
If it is jumping around when your GPS is sending data it could be that the input signal is backwards.
If it just sits there then the signal is not true RS-232 or there is no signal.

If all else fails come on over to Dallas for the Sept ARRL digital conference and we can work on it. We will get to meet Keith Sproul. I don't know if Bob Bruninga will be here.

Rendered body type: text/plain

I second the request posted recently on how to make maps for APRS. I have briefly checked into this but was not successful in finding any reference in APRS documentation on how all those maps were made. I would like to use APRS for some local fox hunts but feel a need to have a local map and would be willing to go through the process (agony probably) of creating it, if I knew the format and or procedure.

Looking for a response from the group.

Sam K3BY.

Rendered body type: text/plain

For those of you APRS folks contemplating a trip to Utah in the near future, the APRS activity is just getting started.

We haven't moved to 145.79 as yet, so you'll find those of us with APRS temporarily camped on the IP frequency of 145.15. Yes, I know about all of the issues of sharing a "connection oriented" frequency, but APRS is only about a month old here and we're still getting organized.

Sorry, no hf gateway yet, but there are two digi's to use -

High level coverage (9000+ feet of elevation) is provided by KF7TA on Farnsworth Peak west of SLC. Dan should be aliased as WIDE as well by the time you read this. Also, KF7TA is not continuously operational. Dan removes his radio on shift change (he works a weekly rotation as a station engineer at the top of the peak), but has excellent coverage when he's up there.

The other is WA7SLG aliased as UUGATE for Salt Lake metro. There are a couple of locals aliased as RELAY at the moment.

These stations are currently beaconing posits -

KC7CO-1
KC7CO-2
KB7WUY-2
KD6OAT-3

349. GPS to KPC3 problem update

From: kc5ejk@onramp.net (Robert Winingham)
Date: Mon, 21 Aug 1995 13:13:29 -0500
To: aprssig@tapr.org
Message-ID: <v01520d02ac5e7cd155fd@[199.1.11.136]>
Rendered body type: text/plain

> I again found that
> it would show one string in the LT buffer but would never update like it did
> when i first started all this.
>
> Bill KE4EER
> wnollie@ro.com

This sounds like a problem I have seen on this list before, I hope some others can suggest a cure.

I think we may be getting close.

I guess you must be doing all this testing outside so the GPS data will change. :-)

If each time you clear the LT buffer with a LT 1 command then connect the GPS and you only get one NMEA string, that could be another problem.

1. The KPC-3 is looking for the full format of the NMEA string data and is waiting for the end of the string. ie. a carriage return and line feed

```
$GPRMC,080503,A,3250.774,N,09645.645,W,000.0,319.5,290595,.,*04<CR><LF>
```

The NMEA 0183 standard calls for data communication in the form of coded "sentences."

Each sentence begins with the character "\$" and ends with a carriage return and line feed. These last two characters are "control" characters and are not normally printed (for this reason they are customarily shown enclosed in brackets)

2. The KPC-3 memory is not set correctly

Set your LT buffers to record a few of the other NEMA sentences and let me know if they also only fill with one update and never change. or only one fills .

(Clear the LT buffer before each test.)

Here is a sample to set two of the LT buffers to a NEMA sentences that should be standard. Note there is NO blank before the \$ and NO blank after the \$GPGGGA

```
GPSHEAD  
1 $GPGGGA  
2 $GPRMC
```

```
BLT  
1 EVERY 00:00:30  
2 EVERY 00:01:10
```

The following will set aside 5k of memory in the KPC-3 to save a track history.

```
LTRACK 5 LT1 LT2 LT3 LT4
```

** Note the data is stored in the LTRACK buffer at the rate set by the BLT beacon command not the rate the GPS sends data to the TNC.

Do a display of all your KPC-3 TNC parameters using a communications program using a save input function and send a copy to me.

I hope this is not one of those 'High order bits" problem where the control" characters have the 8 bit set high and the PKC-3 GPS string scanning program doesn't know that.

You can use your computer to play the part of the GPS and let the computer feed the NMEA formatted sentence into the kpc-3.

I hope some of our other sig readers can help with this.

Hello Rich: Thanks very much for your excellent suggestion....I have several old mag mounts and actually found a bnc/bnc bulkhead fitting in my junkbox ! I did call Garmin today and confirmed the price for their remote antenna at \$160, which does sound a bit steep.....I was expecting something under \$90 or so, so I suspect some of the cost is due to the active antenna design....likely the reason for the 5 volts on the antenna line. In any case, I will try your suggestion first.....thanks again !

351. Re: [APRSSIG:2920] How to make APRS maps

Sam, there are a few files in the APRSxx.ZIP package that deal with map making. Check the APRS\README directory for:

digitizer.txt	Discusses how to use digitizer to "trace" maps.
mapfix.txt	Discusses the primary map making tool "mapfixxx.exe".
mapmakin.txt	Discusses the various methods of making them.
maps.txt	Discusses the data which make up map files.
maps-cd.txt	Discusses how to make maps from the USGS CD-ROMS or the files you can ftp from the USGS ftp site.

By the way, I am making a map of the Virginia Beach area using the HISTORY function of MAPFIX. I hook the GPS up to a HP200LX palmtop computer and run a program which captures the RMC data, opens the raw data file, writes it, and closes the file every 10 seconds while driving around town. Then you can run it thru RMCTOHTS which reformats the raw data into what APRS would call a history file. This history data may be directly imported into MAPFIX and it will provide a nice pattern of circles you can "trace over" and create your map - the map may be edited time and time again. This isn't the fastest way to do it, nor is it the most accurate. But it is one I've figured out and let's me make the map I'm looking for...HI HI (or is that HEE HEE?).

73 de Dan

352. APRS Telemetry

Bob-
I have enjoyed watching the information pass thru the sig for a while, and since I am very interested in the telemetry aspects of APRS and have not seen much discussion on it here, I am wondering what the status of telemetry is. We have been using APRS in some tests to determine its usefulness in the upcoming Olympic Yachting events here in Savannah next summer. My interest is in tying wind instruments around the race courses to APRS telemetry using a "basic stamp" interfaced to a Precision Navigation, Vector 2X compass module to indicate true wind directions.

I am trying to run APRS on an old Zenith 8088 laptop with two 720 KB floppy drives, no hard drive. I built a floppy with an APRS directory containing all the subdirectories (some empty) including MAPS.

When I run APRS, it stops and says it can't find MAPS, did I use -d to unzip?

Is there a way I can tell APRS about B:\APRS\MAPS?

Thanks

Good luck but you should not need much of it! Try improving on my design by using some of the new low-loss cable that is out there. It is a little smaller than RG-58/W but tougher since it has a teflon type (or real teflon) dielectric. It comes in White, never seen it in black and will need some careful attention when attached to the BNC connector unless you buy some specific for the cable.

I am sure that using the new cable will give you better results than I have with RG-58U at the 1.6 gig frequency! I do fine but you may get a faster lock-in time on your position with the stronger signal.

Bob:

Questions for you please: I'm getting aprs up and running and have successfully displayed the latest maps for my area using mapfile updates. I would like to use my Garmin GPS45 to display it's position on my local map via a direct connection to my PC. One of the helpfiles I read said that it is necessary to register the program to get a validation number prior to attempting local GPS position display.....I will be pleased to register the program in any case, but would appreciate confirmation that a locally connected GPS-PC needs the validation number.

Secondly, I've successfully downloaded a test trackfile using GARDOWN7.....I would like to download and import my testfile to aprs and would appreciate some guidance with respect to either the required procedure or a .doc file that outlines the necessary steps.

APRS looks like a great piece of work and I'm having a good deal of enjoyment getting it up and running ! Thanks for your help.

73, Jim K60YY

Well, what ever you do don't use a subject line that starts with
Mail failure when reporting the problem

I sent a few messages with a subject of: Mail failure problem
and they all seen to get adsorbed by a parser.

You know better than that! Unless you are in immediate control of the radio you could be in "deep kimshe".

I know that it seems tempting. I realize that the chances of getting caught are small. But cutting corners reflects badly on all of us and would give those who covet our frequencies a real good argument.

Hi Jan,

Just an idea for you to think about, CB radio. No license required, cheap,
and with legal power at 1000+ AGL range should be a moot point.

Ive had several brief conversations with Bob about this (we were looking at
the same license issue with Coast Guard Aux members) but it turned out we
didnt need go that route.

I think a "beta test" program might be in order, comments anyone?

APR REPLY: In my opinion, the lowest-common-denominator radio is CB.
Anyone can buy one for \$49 at radio shack, and have a nice compact 12
volt 5 watt radio. Ideal for APRS. I mean, what is CB, except for the
MOBILE PUBLIC? I have been proposing channel 29 for APRS. Here are the
main issues:

1) YES, there will be a performance penalty for using AM, but over water
(boats) and from the air, the S/N ratio over short paths should be fine!

2) The CB rules say tones ARE LEGAL for the purpose of "establishing and
maintaining communications" as long as the tones are less than 15
seconds in length.

3) ANY device must connect at the MIC connector, no internal mods
permitted.

4) Selective calling devices are legal, and there is NO DEFINITION in
the rules of what a selective calling system is. I also confirmed this
by phone call to the Wash DC FCC Engineer...

5) Digital communication and data transfers are prohibited.

For the purpose of legality, I have made a version of APRS called CPRS which stands for CALLING AND POSITION REPORTING SYSTEM. In MY opinion, it is perfectly legal on CB as long as you do NOT "USE IT FOR DIGITAL TRANSFERS OF DATA". As a SELECTIVE CALLING device, it is perfectly legal. I would stay away from the aircraft radio, we might get FAA or who knows who on your back.

In reply to the message about making a WIND sensor for the SAILING race courses in South Carolina, I suggested using simply a PacComm TNC or other GPS TNC and the ULTIMETER-II until I realized the idea was for buoys on the open ocean...

OOPS, I see, the course is out on open water!!!

My idea there is to put a GOOD swivel on the anchor chain, and put a very strong BAR magnet below water level as the ballast. Make the whole instrument as hydronamically symmetrical as possible, and then toss it in the water. The bar magnet will align to MAGNETIC north as good as any FLUID compas, and you can offset the U-II orientation according to the local magnetic Variation. And again, you are DONE!

I would house the WHOLE thing in a long piece of PVC pipe so the wind vane sticks up very high, and the ballast is very low... In fact, If you use the PacComm dual serial port TNC, you can put a GPS in each one too, and just let them drift!!! That will eliminate ANY chance for the anchor chain to screw up the NORTH orientation...

> When I run APRS, it stops and says it can't find MAPS, did I use -d to unzip?

APR REPLY: APRS must also find the FIRST map pointed to by the current MAPLIST in use and the configured position. For a new start, aprs will look for the USA.map. But if you have saved a CONFIG file, and the starting location is timbuktoo, then there has to be the timbuktoo map or you will get the APRS error you described... From then on, APRS pretty much ignores maps if they are needed but not there....'

(snip)

"Selective"....Yup, just those stations running CPRS (I can see that)
but would there be WX stations ? (I don't think so...transfer of WX data)
would there be DF info ? (same reason)

would there be Bullitins, and/or direct station to staton comms? (same)

There may be more prohibited modes, but it's late and I can't think.
Sounds like a VERY restricted/crippled version of APRS. Don't know if it
would catch on. (but it might encourage a few folks to get a ham ticket)

APR REPLY: CORRECT. PACKET AS IT HAS BEEN KNOWN FOR 15 years is NOT
legal on CB. But SELECTIVE CALLING IS LEGAL, and there are NO FCC
standards for "SELECTIVE CALLING". I'm sure lawyers on either side could
make a convincing case for either way. That's why I am going to modify
APRS and call it CPRS and take out all but ONE line for messages. That
makes it a selective calling device. All modern SELCALLS provide for
several bytes of data in the SELCALL other than just the call... Why not
a position?

Channel 29, use it or lose it, hi hi....

Jan A. Barglowski asked if using packet over AM aviation frequencies
was legal; not especially, unless you have a waiver from the FCC to
allow it. They are rather particular about what goes on in the various
aviation bands.

As for full-carrier AM for packet, that should work, since the tones
are well within the voice range specified for aircraft radios (2.7KHz
max, sharp roll-off by 3.0KHz), and would likely work even under the
"narrow band" frequencies proposed for Europe (8.33KHz channel spacing,
vs. the current 25KHz).

Hello all, it is my first message on the SIG.
I have purchased a active antenna with mag mount for my Garmin 45 gps
and i saw a big difference in the reception.

This antenna have 26 db gain and now i can track 8 sat at time with
exellent signal. Before i was received only 3 or 4 sat.

The model is L1 and was bought from "High Tech Direct" in Kanata, Ontario.
It was the best price i find 139 \$Can. the phone is 1 800 268 8628.

Hope this help and hope also you understand well my poor english writing.

In Europe, CB radios come with FM, and it works great. Usually the rigs are American models (and are FCC aproved!). Don't know if it is possible to find these here.

I made packet at 1200 bauds myself with one of these rigs and a PK232, it works well (although illegal in most countries). The tnc is connected via the mike and the external speaker connectors.

Hello All:

Just a quick note on an antenna we've been using for a while now, which seems to do a good job with our Garmin 45s. Several of us in Savannah have ordered the model 90LL13800 form MicroPulse Inc. in Camarillo, CA (805-389-3446) and really like it. It is a small flat patch antenna which can be orederd with a magnetic or suction cup base with 10' of RG-316 cable with a BNC connector. It is an active antenna and seems to achieve lock faster and hold lock under trees etc. well. After using several other combinations of cables to remote the standard GPS 45 antenea for vehicles and boats, we have found this antenna to be a great improvement in signal quality. The cost is around \$75.00 with shipping. The folks at MicroPulse seem to be pretty good folks to deal with, and we recieved them in about a week.

Regarding vehicular/marine GPS antennas, I have found a source of OEM antennas that seem to be very high quality at a more resonable price. I am presently testing one of these antennas with extremely good results. The antenna is a hocky puck style antenna of very high quality, the one I am testing is hooked up to a Garmin 45... I am planning to purchase a quantity of these antennas for the marine business if all works out as planned, if so, I will advise the APRSSIG... More information to follow as it becomes available...

Hi Jan.

Just an idea for you to think about, CB radio. No license required, cheap, and with legal power at 1000+ AGl range should be a moot point.

Ive had several brief conversations with Bob about this (we were looking at the same license issue with Coast Guard Aux members) but it turned out we didnt need go that route.

I think a "beta test" program might be in order, comments anyone?

I have to agree - the CB route is the way to go, especially since there are so

many rig options available - cost, size, weight, power. Even with a relatively inefficient loaded and shortened antenna, the coverage would be great. Perhaps in conjunction with a CB-2meter gateway?

I visited their booth at the Huntsville Hamfest Saturday and mentioned Bill's problem. I asked them why they didn't have some sort of "technical notes" that outlined how to connect up these GPSS. Their response was that "no one ever told us how to hook them up".

Bob B. -

Phil asked the question I had been saving until all the latest revisions were complete. (Didn't want to get in the way of Meteor Scatter)

Since you are supporting old CGA laptops (and I do have one- a Toshiba 1200), how about allowing us to specify what drive (I have A and B, but no C) certain things are on. I'd like to put maps on my 2nd 720 K floppy, but right now it sits unused. I think Phil wants the same thing

Thanx

Ralph

Nolle reports that my single point removal command C in MAPFIX15 is properly now removing the single point lines, but is also generating a lot of random lines in the process. Here is my thoughts... Can anyone confirm that this is what is happening?

The Single point line removal algorithm MAY be removing the point and then it might be joining the previous and next lines together. See if this is what you are seeing???

385. CAN DO APRS on B: drive!

Syntax is Append B: or Append B:\directory, this causes any program (supposedly) to look at the appended directory if the file sought is not in the listed directory....it is the equivalent of the path command for data files.....

HSP cable connected to Notebook, GPS and TNC. APRS will only see the TNC on-line, and work normally, no GPS data is coming in, HSP Timeout keeps coming up on the upper right of the screen.

HSP cable connected to Notebook, and GPS, I have unplugged the TNC from the pigtail. APRS sees all the GPS data coming thru. APRS displays any

NEMA sentences on the bottom of the screen and posts the latest RMC line as a P screen update, printing of my car works just fine on the map. I re-connect the TNC to the cable and the GPS drops out again, all I have is the TNC showing up on the screen.

Well based on that and a conversation with Bob WB4APR and Paul at PacComm I took and supplied voltage to pin 6 of the HSP board. No voltage was seen at the serial port so I took +8v from a SMT resistor UNDERNEATH the HandyPacket's PC board and ran it to pin 9 of the HandyPacket's DB connector which is not used. At the pigtail side of the connector I ran a small wire from pin 9 to the HSP board's pin 6, easy enough ?? Seemed that the HSP was not being powered up, right ?? WRONG... the HSP board now has power BUT it is still showing the same problems as before. It looks as if the switching circuit is not switching from the TNC (normally closed (in line)) to the GPS (normally open(out of the line)) but now that the HSP switcher has power it still is not switching!

Any ideas the clock is ticking away....
BTW if you know the fix or have a really good idea at what is wrong give me a call, collect. The phone number is (407) 745-2404 and when the operator (or computer) asks for a name give your callsign so I know to accept the call. I may not be in early tomorrow night but if you call on Wed try to call after 8-9pm, tonight Tues., you can call whenever.

Rendered body type: text/plain

There appear to be two problems with your interface. Look at the schematic in my GPS.txt.

1) you say the GPS data passes through ALL THE TIME when the TNC is NOT connected. This implies to me that the 2nd NPN transistor is NOT clamping the GPS data OFF. If there is a +V voltage on the DTR pin of the PC, then I don't see how it can NOT be clamping the GPS.?? Are your grounds intact? The presence or absence of +v supplying the whole HSP circuit should NOT matter for the CLAMPING action.

TEST: Connect a voltmeter to the DTR output of your PC and it should go to a NEGATIVE voltage whenever APRS tries to get HSP data. It should be POSITIVE all the rest of the time. If this is OK and toggling, then apparently your GPS output is too strong for the clamp circuit. Try inserting another 1k, 2k, 5k 10k in series with the GPS data.

2) When you connect the TNC, the continuous GPS data stops and even when APRS toggles DTR, the GPS data does not come through... This tells me that the TNC may have a really good negative pull down through the 10K resistor on the RXD line which may be too strong for the GPS to overcome through its 1K and 3 diode voltage drops... If this were the only problem, then try placing a 2k, 5k or 10k in series with the RXD from the TNC.

If you are looking at a recent copy of my schematic, ignore the added NOTE1 and NOTE2 resistors, diodes and switches.

But these two problems seem mutually exclusive. In one case the problem is the GPS is too strong, and the other is the TNC is too strong. These both cannot be true...

NOTE: When I say try a resistor in series, you should find the largest value that still solves the problem and then HALVE it for the final installation.

Tell me what you find.

389. Mapfix15

Regarding MAPFIX15.EXE i in fact find it useless in it's present form. in some maps created from the Cd-Rom are about 60 percent that have the additional lines, now what's strange tough is that not all maps have this problem. I have made some that had only a few. I attempted to create 3 new maps today and they all had to be deleted because in order to delete those lines and redraw them would have been to time consuming.

>we're thinking of using packet over his aircraft AM radios. Are there any
>potential problems, legal or rf-wise, with doing this?

I checked into this a little before settling on 2 meters for the sailplane experiments to date.

Here is what I think that I know about the legal stuff:

Aircraft radios at VHF are only authorized A3E per part 87 (Aviation Services). Specifically the table in 87.131.

F2D only shows up at UHF frequencies. I still haven't figured out how to get a license for UHF frequencies.

A possibility is an STA for VHF, but I have no experience with this.

Now, some practical issues:

Sailplanes operate on only two aircraft frequencies 123.3 and 123.5 MHz. Current activity on these frequencies sometimes gets excessive, and it is common for pilots to turn off their radios while flying cross-country to avoid the noise.

Operating packet on either of these frequencies, even if legal, would make your friend very unpopular. When packet first came out, we attempted to share packet and voice on some 2 meter repeaters. Having to listen to packet was very annoying to human operators.

Of course there are probably some other frequencies available in certain situations. There are blocks of frequencies that appear to be reserved for things like flight test, etc. Use of these would undoubtedly require discussions with the FCC.

If anyone has any comments or ideas on the above, please E-mail directly to me (or post if of general interest).

The above comments should not be interpreted as discouraging a unobtrusive tone burst at the beginning of an audio transmission, subaudible tones, or whatever. I don't know about the legality of these, but they might be neat.

A permanent 2 meter antenna has been set up at El Tiro Gliderport (near Tucson) and we are continuing to experiment with tracking sailplanes. I welcome information or inquires from anyone else with a similar interest.

APR REPLY: SOON now, I will be making available a kit of parts so that you can hook up your stand-alone-tracker to your VOICE radio and it will send out a PACKET POSIT at the end of your voice transmission.. If anyone is interested in this, go ahead and start figuring out how you are going to connect 5 wires to your MIC connector. GND, PTT, RCV audio, XMT audio, and a second PTT...

I checked on the MFJ MIC/TNC patch box, but, of course, they were out of stock and expected more sometime in the future.... hi hi

Looks like a back-to-back 8 pin male-female combo with a 5 pin DIN plug will be the trick.... More later....

Does anyone know how to stop the BEEP that some users put in their BEACON texts?

In APRS there is a facility to eliminate the APRS-generated beeps, but not a command that I've seen so far to suppress the user-initiated beeping.

Unfortunately, my TNC (a DataEngine) does not have a command (that I've found, at least) to send all the CTRL-G characters to the bit-bucket.

Any ideas?

Another thought: Obtain a license in the Itenerant Business service, and use UHF, using either the TEKK or Maxon radios. Low power consumption, no risk of intermod, IB frequencies do not seem to interfere with GPS, small antennas, small stand-alone trackers.

Kinda like a cow box...

Dunno how we got involved in being quoted as saying
"no-one ever told us how to hook them up" (Magellan + TNC)

It would have been difficult because PacComm wasn't at Huntsville
HamFest !!!!!!!!!!!!!!!!!!!!!!!

I think you mean Kantronics ??????????

Regards,

405. Huntsville Fest

From: wnolle@ro.com (William Nolle)
Date: Wed, 23 Aug 1995 09:00:10
To: aprssig@tapr.org
Message-ID: <199508231405.JAA00175@sh1.ro.com>
Rendered body type: text/plain

Although i'm not the one that said that, but the message was directed to me
specifically. What Ralph N4NEQ was talking about was in fact KANTRONICS!.
It was in relation to the constant problem i have been having trying to make
my Magellan NAV5000DX work with a KPC3. Nobody at Kantronics could shed
any light on the reason why their KPC3 will not except input from my GPS
even after the 4 phone calls i have made. So Ralph gave it another try by
talking to the KANTRONICS PEOPLE AT THE HUNTSVILLE HAMFEST!.
No help their either!. So again the moral of the story If you have a
NAV5000DX and you want to use it for APRS GPS tracking DON'T use the
KPC3 it won't work, i have been working on it for 3 weeks and finally figured
it wasn't worth all the aggravation and expense of all the long distance calls.
O yes i also called Magellan several times. So i have now been offered an out
for my problem by the good people at PacComm, more about that later. I have
used a Tiny-2 MK-2 with this same Magellan GPS receiver without any
problems at all. and NO i'm not being paid to say this. It's the facts folks!.
I hope this will set the story straight that it was not PacComm N4NEQ was

talking about.

Well i have to say i started this morning downloading 9meg of data from USGS and it's really a pleasure making maps using USGS2MAP.BAS. It's actually fun using this program. Bob are you listening Hi. Jack Cavanagh and additions by Bob made this a program that's a pleasure to use. I was going wild this morning and made a map covering MS,AL just the county's for our heavy weather net that we run when the NWS has warnings out for the area. Bob if Mapfix15,16,17 or whatever could be made to work like this software i would be willing to send you another registration for the Map software only hi. I know it's not that easy since we are working with totally different data files, but a guy can dream can't he. Just wanted to let Jack and Bob know that i'm having fun making all those maps, it's almost as much fun as running APRS (Almost!).....

407. APRS beeps

From: Jerry Wyatt <jwyatt@amex-trs.com>
Date: Wed, 23 Aug 95 07:45:26 -0700
To: aprssig@tapr.org
Message-ID: <9508231445.AA24579@lineng.ipc.amex-trs.com>
Rendered body type: text/plain

APRS beeps:

Several versiona ago, Bob placed a "junk" filter in APRS that is optional. I had requested it because other BBS'es send binary headers and they often clear, scroll or beep on the screen. Bob added a 'junk filter' that removes/doesn't display any none ASCII printable characters. This change when turned on stops all this garbage and displays a msg at the bottom of the screen when it detects 'junk' in a msg.

I recall the command is 'C', 'Filters', 'Junk filter'.

Try it, you might like it like I did!

I use the junk filter up here in Northern California and the screen still
keeps blanking out. I am hearing BBSs and nodes on 145.01 that seem to be
sending something that blanks the screen.

Any ideas what else I can set to keep this from happening. I hate to keep
hitting the space bar to bring the display back all the time.

Well, I was not able to make Huntsville either (last time I did I was actually
there to support a Shuttle Experiment, but I digress).

I have been working with one of the Pico Packet TNCs from PacComm for the last
month or so, and have to report a failure.

Specifically, I've been unable to find any problems, and I've exercised it
pretty well between the Shuttle APRS deal, and local packet activities. It's
just sat there and played along with my IC-970A with no (zero, zip) problems I
can find.

So, I guess I failed as a tester!

MFILTER which is a TNC-2 command should do it. Set it to 7 to filter out the
Ctrl G characters. It works with my PK-232. Check your manual to see if your
DataEngine will do it. The PK-232 also has a feature to block all control
characters except CR and LF if MFILTER is set to 128.

Thanks for the suggestions, but the JUNK FILTER in APRS does not work in
this application, and the Kantronics DataEngine does not support the MFILTER
command that Barbara Fehner recommended.

Any other ideas?

There's probably NOT a way for Bob to filter Beacon-imbedded Bells out in
real time, since they are basically dumped to the screen, eh?

As I am currently using a dedicated 286 for this task, I guess it's time to
open the thing up, and pull the speaker leads.

Message-ID: <Pine.3.89.9508232223.A11666-0100000@pbfreenet.seflin.lib.fl.us>
Rendered body type: text/plain

After many nasty hours of trying various configurations and suggestions from both Bob WB4APR and Paul at PacComm I have finally been able to succeed with geting the HSP cable to work!

My configuration is as follows....

Toshiba Satellite 2105CS Notebook

Garmin GPS-50

PacComm HandyPacket

PacComm HSP CAble board revision 1.01

The HSP cable must be powered from inside the HandyPacket, I have taken +v from the battery pack solder point at the front PC board and run a small wire to Pin 9's solder pad at the rear of the mail PC board. From here run another wire into the main HSP circuit board and solder to pin 6 at the 9 pin connector. Problem #1 is now Solved! no power for circuit..

Add a 1K resistor accross TD3 which is at the bottom right of the circuit board when looking at the first 5 pins of the DB 9 connector pointing up. I suggest to use a 1/8 watt resistor since the SMC resistor you are adding this to is quite small.

I will explain this a little better if anyone has the need for it. I forget which transistor to look at for switching but this will be a good point to check if you are wondering what is going on. Right now ALL of the equipment is in the truck which is in 2ft of water after Tropical Storm Jerry passed directly over this QTH! I am not going out there now to get more exact locations and readings from the circuit board!

I thank Paul and Bob for the several phone conversations this past week so I could have this working by Friday. I am looking forward to see everyone in range of I-95 this Friday and Saturday from FL to NJ, and I will be in NJ and DC areas for about another week before the trip back South.

Rendered body type: text/plain

Can someone straighten me out, please?

On the 'D'page (where the PATH of each station heard is shown) what is the meaning of the "*" before and/or after the station call in the first colum? I understand that IN THE DIGI PATH it means that it was the last station that you heard digi the listed call. (I'm not asking about the digi path, but the first colum listing)

I understood that when the "*" is BEFORE the call (in the first colum) that I was able to hear the station directly. But I see such listings on stations well outside of my call area, and can only reach me via HF.

What does the "*" mean AFTER the call? BEFORE & AFTER?

THAT WAS A BAND OPENING!

Unfortunately, all it takes is for you to hear one packet via tropo, meteor scatter, airplane reflection, or any other mode that lets you hear the packet DIRECT. From then on the * (added by APRS) STAYS THERE... You have no way of knowing how many got through direct. But you can turn CONTROLS-FILTERS-DIRECT on and then your station will IGNORE ALL packets EXCEPT those that are direct so then your HEARD log only will see DIRECT packetts..... But you wont see anything else... hi hi

Maybe someone on the Fox-list can help. This message crossposted
from r.r.a.homebrew... -Fred KD4WOS

And now I cross post to APRS SIG

Ralph

@SUBJECT:World Record Attempt, High Power Rockets
@FROM :UYFA59A@prodigy.com
@MSGID :<415t18\$12ui@usenetz1.news.prodigy.com>
From: UYFA59A@prodigy.com (James Cullen iv)
Newsgroups: rec.radio.amateur.homebrew
Date: 19 Aug 1995 23:44:40 GMT
Message-ID: <415t18\$12ui@usenetz1.news.prodigy.com>

Help!

The Las Vegas chapter of Tripoli -- the national association of high
power rocket enthusiasts -- is preparing to challenge the world
altitude record for high power rockets -- currently about 37,000 feet.
We need help locating plans or a schematic for a tracking transmitter,
antenna and receiver for the record attempt. Here's what we need:

The transmitter must be able to fit into a tube that is 1-1/2" in
diameter and no longer than 12 inches. It must operate for a minimum
of one hour on batteries and be as light as possible. The operating
frequency is not important as long as it is in the amateur bands. We
need a minimum range of about 15 miles line of sight. The body of the
rocket is constructed from phenolic-impregnated Kraft paper overwrapped
with fiberglass. An antenna can be glued to the outside of the rocket
body -- perhaps copper foil tape or some similar method. Radiation
pattern from the transmitter should be omnidirectional, because we have
no idea as to the position in which the rocket will land.

The receiver can be just about anything that we can carry, as long as
it is battery operated. The receiving antenna should be highly
directional and hand held.

If you have any suggestions on how I can obtain or construct a
transmitter/receiver combination that will accomplish this task, please

e-mail me at

UYFA59A@ Prodigy.Com

If you have any interest in being a part of this, let me know also.
The attempt will be made in about 6 months, most likely in the Black
Rock Desert of northern Nevada -- about 80 miles NNE of Reno.

Thanks very much for your assistance.

Tom, Maryland Emergency Management has had a demonstration of APRS. Some of the Maryland counties and the District of Columbia have also used APRS in their Emergency Operations Centers for ARES/RACES and public service

operations. SKYWARN should be part of your ARES network and APRS can be a very valuable tool for that network. Contact your ARRL Section Manager and set up a demo of APRS for him. It works for me! 73 - Bill WB3V MDC Section Manager

428. Bounces (was Re: [APRSSIG:3002] Re: Test)

From: Howard Goldstein <hg@penny.n2wx.ampr.org>
Date: Thu, 24 Aug 1995 13:51:35 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.LNX.3.91.950824134520.171A-100000@n2wx.ampr.org>
Rendered body type: text/plain

So far at least three folks have complained about bounce messages.

I've never seen a one of these; I imagine those of us who do more lurking than posting here haven't seen them either.

It appears these bounces are not coming from the list, but rather they are travelling direct from the bouncing MTA to those who are posting to the list. To confirm, check the headers on your bounced mails. sys1.tapr.org does not appear as a Received: MTA.

Whoever owns this list (Bob?) may want to ask Lee to run the script that'll help you detect and remove the bounces.

The listproc Lee deals quite well with bounces that go back to the listproc. But those that head back to the author (the guy in the From: header) can't be detected by listproc.

Howie

Rendered body type: text/plain

I agree with Howie, here is the header from a bounce off my last post:

Return-Path: <Mailer-Daemon>
From: POSTMASTER@redriver.ksc.nasa.gov
To: wjh@ideas.com
Subject: Mail failure
Date: Thu, 24 Aug 95 14:20:00 EDT

[002] Mail was received that was addressed to unknown addresses.
Mail item was not delivered to:
PAYLOADS/REDRIVER/nguyent

So it looks like there may be a bad address in APRSSIG for a NASA user.

Rendered body type: text/plain

I should have never composed the message I did last night while I was half asleep! The component's I had mentioned were not intered correctly the fix stays the same but there are the correct parts ID.
1K resistor 1/8W tack soldered across RD6 a SMC resistor.
To check the proper HSP switching monitor the voltage change at the collector of TD4 a SMC Transistor. This will be the lead on the "long" side of the part next to RD10. I get about +6 volts when it toggles.
This may or may not be necessary but in the TNC's connector (HSP Cable) I have inserted a 10K 1/4 W resistor at pin #4 which is a brown wire. Since it is working now I am not messing with it, try yours without it, if it fails try adding the resistor, I am not going to bother taking mine out.

Take all of this with a grain of salt!! This fix may or may not work for you. It seems that the fix will vary depending on what equipment you are using. This does work with a Toshiba Satellite Notebook, Garmin GPS-50 and a PacComm Handypacket TNC. The real problem with the circuit seems to be that everyones equipment is a little different and the circuit needs to be modified to make up for variations in voltage and voltage differentials. Hope this helps someone.....

Hi Gang,

>Unfortunately, all it takes is for you to hear one packet via tropo,
>meteor scatter, airplane reflection, or any other mode that lets you hear
>the packet DIRECT. From then on the * (added by APRS) STAYS THERE...

Bob, the confusion is that if a VHF LAN station is hearing the GATE station direct then star is put in front of that line. This makes it appear that the timbuctoo station was heard direct even though the packet came via the gateway.

Check this please and advise if we're misinterpreting. We discovered this a couple of weeks ago and I was supposed to advise you but it slipped my mind.

Good points, Howie. I revisited the bounced messages I'm getting and the MTA at KSC appears to be parsing the From: line correctly, and sending messages to the originator. Since I'm not worrying about it (I read those with the D key usually) it's no issue for me.

My comment, now obviously in error, was a knee-jerk answer based on previous experience. I really should have delved into it deeper!

We are presently generating interest and activity in the Texas Panhandle concerning APRS, primarily for use as an ARES and SKYWARN tool. I have been promised the access to RCM data to transmit on packet this year. I am primarily interested in how other groups, areas, etc. are using APRS in ARES and SKYWARN operations, I envision it making it a lot easier to keep track of sometimes 20+ spotters spread out over 250-300 miles chasing numerous storms as an ARES EC and SKYWARN net manager. Any thoughts and ideas on how APRS is being used in ARES/SKYWARN operations would be appreciated.

73 from the land of Tornadoes, had 64 confirmed in 31 county Area thanks to the excellent work of the ARES spotters. Ben WS5R Potter County Texas ARES EC

First wai :Louis Kruger ZR6ABC. Vice-chairman of SA Amateur
Telecommunications Institute. (SAATI)

I am very interested in APRS and am trying to get APRS promoted in South Africa. I regularly take the APRSSIG messages and upload it as buletins on the ZAF packet network. After a week or so I send out a test message to find out what the interest were and got a few replies that I must please not stop, even from a guy in Zimbabwe.

To enable me to promote it further here I have a few questions that somebody on this SIG can help me with.

1. How and where can I register ?
2. What do one have to do to become a map coordinator, for our country and for our local regions ?
3. I can lay may hands on maps in Vector Relational Format, is there any conversion programme for that ?
4. Do anybody have a description of the DLG format of the USGS CDs, so if necessary that I can try to write a convertor for APRS from DLG (Digital Line Format) ?
5. I can be reached at :
Louis.Kruger@iplan.co.za;
ZR6ABC@ZS0DL.D.TVL.ZAF.AF,
(27) (12) 345-3275 (H)
(27) (12) 450-2530 (W)
TZ=GMT+2.

73's de Louis, ZR6ABC.
(I don't have wisecrack now !)

446. APRS in ZS-area (South Africa)

RE: South Africa Maps

I have some world data that will be able to be converted to PC-APRS maps in the near future.. Sometime early fall? I will keep this list informed of what is going on with this world data so that you can get some good maps of South Africa.

- > I can lay may hands on maps in Vector Relational Format, is there any
> conversion programme for that ?

Can you give me a pointer to this data? I can write the converters for it fairly quickly? I need the data itself and a description of it..

For the last year or so, APRS has been able to operate in a multiple PC network cobbled together in the field, by simply connecting multiple PC's via 2 or 3 conductor zip cord to a single TNC/RADIO. In an emergency operations center, this has the potential to give every operator and individual full APRS access to the tactical picture, focused on his own immediate communications needs. The beauty of the parrallel RS-232 connection is that it takes nothing but connectors (see OPS.txt). No special software or networking configuration is required.

I never thought that there would ever be a group of HAMS all already connected by a permanent network, so I never looked much further than that minimum capability. Now I have been approached by a small company that wants everyone in the office to have APRS access for tracking their vehicles...

HERE IS THE RESULT:

APRSNET.txt APRS NETWORKING

APRS can be operated in a multi-station environment so that many PC's on a network can see the APRS tactical picture being maintained on one MASTER APRS PC. Typical applications would be a company where many people throughout the organization need to see the location of their mobile units. One PC on the local area network is dedicated to APRS, and is connected to the single radio and TNC. This PC periodically posts a file containing the complete APRS tactical picture. Then any other PC on the network can be configured to come up as a slave APRS station. The slave PC will automatically download the tactical data file and present the user with the latest displays as if they had been running all along.... These slaves cannot send any packets, they have read-only access.

Again, since I see no HAM application, this is only a commercial option. But it sure is neat! Of course, if your EOC already has a local area net, then this is ideal. Our EOC only has ONE PC in the whole building!

Oh Bob!

This would be the answer to a big problem I have! I have a network here in the house, and N4NBL has a 12 station Novell network in his house. (I know, "Computer Geeks")

It would be great for my basement APRS station in the shack to write a file out to the lan that my upstairs PC (no radios nearby) could read. It seems like it could also be the basis to some internet linking of APRS nets.

To: aprssig@tapr.org
Message-ID: <v02130501ac6478fb4d77@[199.1.11.103]>
Rendered body type: text/plain

Reference: 1995 ARRL Digital Communications Conference
September 8-10th, 1995 Arlington, Texas

APRS Workshop, Friday, 4pm - 7pm. Conducted by Keith Sproul, WU2Z

It is 2 weeks to go until the DCC and I am wondering if there are any items I or our Dallas APRS group (all 4 of us) can bring to your workshop and talk.

We can set up a WIDE dig in a car in the parking lot for you. I don't know if our Dallas APRS base stations will reach the conference site.

I can offer to bring my Lunch box size battery powered portable GPS tracker. It has a KPC-3, Garmin-45 with active mag mount ant and a HTX-202 7 watt Radio Shack 2 meter HT built in. I could leave it in the car to send data or in the building to try to act as a relay.

I also have a computer mobile setup that uses my two serial port PB-540c, a second KPC-3 TNC, a second Garmin-45 GPS unit with active mag mount antenna and a ICOM-W21AT 2m/70cm HT. I also have a unused PK-12 TNC.

I can bring a Apple CD-rom drive that I connect to the PB using the APS SCSI DOC. I use the CD-Rom to run the USGS disk or the Mac / PC version of Street Atlas USA. I could bring a 512 MB SCSI hard drive with backup software if needed.

The Mac PB 540c has Softwindows loaded so I can also run PC APRS and some of the PC mapping programs.

I do have a power book video adapter cable for the 540c. I also have an old Apple 13" B/W monitor I keep as a spare for the Dallas MAC/HAM BBS and the Apple 13 Color monitor that I could remove for a few days from the BBS system.

Let me know what the Dallas area APRS group can offer to do to help.

I only have the 1:2,000,000 CD-ROM maps of the Dallas Fort Worth area and if you have something better please send in advance.

I will post this to the APRSSIG so we can roundup any other local help.

Bob - Dallas,TX --- kc5ejk@onramp.net or kc5ejk@amsat.org ---

I too have a rather sizable network at my house, and I like to run MacAPRS on a computer in the shack, but since I spend most of my time on the porch (with the nice ocean breeze) I use Timbuktu to remotely control the shack computer. That gives me full access to the program, just as if it was running on the local computer. There are versions for PC's as well, and I would say this is the easiest way to accomplish this. Timbuktu allows for multiple 'watchers' that see everything on the screen, and one controller at a time. This would also work well for an EOC type setting, where many users might need to access the data.

Instead of setting the frequency of position reports in units of time (eg. every 5 minutes); wouldn't it make a lot more sense to specify the frequency of position reports in units of distance ? (eg. every 100 ft.) This would remove some of the clutter we are getting now with stationary vehicles beaconing away madly every few seconds and fast moving vehicles not beaconing often enough. Of course there would have to be sanity limits top & bottom: no more than once every 2 seconds; at least once every 30 minutes, or something like that. This code could exist in the aprs program, or in the tnc's (but the tnc would have to parse the gps data to determine the delta distance). The most logical place for this code to live would be in the GPS itself. What think ?

As I understand it, some of the TCP/IP packet guys are using Internet links to cross vast distances.. To have that same ability on APRS would mean the ability of a mobile on vacation being seen and/or getting a short message back to his buddies on APRS even though he had reached an area where no path existed back to his home QTH. If this were ever to develop, I imagine that some additional features would have to be implemented to avoid redundant data, and other problems. Perhaps the Internet gateways would use some sort of a special TNC/converter to add the features of WIDE-N networks like described in "DIGIS.TXT."

APR REPLY: Thats sort of in there now. For APRS mobiles, a new position is not transmitted unless it is more than 80 yards from the last. Similarly on receive, new packets are NOT logged unless they pass through the same filter. I had toyed with the idea of a distance based algorithm, but then you do have fast movers, and you have boats. Sailboats go slow and want to track it closely..

All of this doesnt help the TNC tracker, unless the TNC parses the data..
It would be a nice addition to TNC's

We just got the equipment for a voice and high-speed digital station at the NWS Forecast Office in Monterey, along the Central Coast of California. My hope is we attract folks throughout the ARRL Santa Clara Valley Section (if not others) to put automatic stations on 2m using 9600-baud, as suggested in the text files that come with a download of APRS (WX.TXT):

REPORT BROADCASTS - The individual station weather conditions can be manually placed in the Beacon Broadcast from each station or automatically using the APRS WX option (\$9) and ULTIMETER-II serial interface. These reports are typically broadcast every 10 minutes. The report is also available at anytime if an APRS user sends the WX station an APRS Query. There is a special WX query that will request all WX stations to immediately report.

Anybody tried this yet?

Rendered body type: text/plain

It is my turn to ask for help. I bought an Ultimeter-II in Dayton and have finally gotten around to hooking it up. I am having some problems. Anybody got any ideas?

My shack PC pretty much has been running APRS7B the past few months. I connected the WX station and put in my reg numbers. The top of the screen said something like "getting weather Data" and just sat there. The O C W command showed me the data dribbling in from the ultimeter just fine. My dot on the map never turned blue, my entry in the P list never showed U-II, and the second line of the screen (right below "range") displayed a 45 or 50 character string beginning with the # sign.

I decided nothing was going to happen, so I decided to try version 72D.

With 72D, things happened quickly:

I saw a blue dot on the map where I was.
The pc started madly beeping (like an alarm). I could not stop it.
The upper right of the screen displayed a message like: cfig71d.apr Bad-#
The beeping slowed everything down to a crawl- Seemed like it would take forever to QUIT out of the program..

Several times, I tried deleting the CFGxxx.APR file and starting over. Each time, APRS did the same thing. I then unplugged the WX station from comm 2 and it STILL did it.

Anyone know of a a problem in 7B? Anyone hear of a problem with 7D? What am I doing wrong?

Thanks

Ralph

457. Laptop Scrunch

What's the latest on this? It has been discussed before and I know there are several brands that have it- but has anyone found a solution?

My hard drive crashed on the monochrome Compaq laptop I had, so I borrowed a color IBM Thinkpad 750.

Immediately, I noticed the dreaded "laptop scrunch". I ignored it until one day when I was playing around with the setup program for the laptop. It had an option called "expand vertically" or something similar. I activated this, and no more scrunch!

Today I was installing APRS72D on a Winbook color laptop. Again- the horrible "laptop scrunch". Try as I might, I couldn't get rid of it.

Anybody ever find out why this happens and what to do about it?

Richard- how can you only load "part" of Dos 6.2. Have you ever compared
the size of the older command.com (and the 2 hidden files) with those of 6.2?
3.1 is much smaller and uses less ram. That allows more space for other
things and allows the machine to have a bit more memory for operation of the
program. Also remember that loading Dos high is not an option on an 8088,
so a small dos is very useful.

You may have thought I meant that the associated programs that go along with
DOS were too big-

APR: The only thing I can say is that APRS is "nailed" to a 640 x 350
resolution screen (or 640x200 in CGA/EGA). Many laptops may have LCD's
that permit up to 640x480, and they don't bother to convert. They just
display the 350 using only 350 of their 480 lines...

Hello Wayne in Sycamore Ga. WD4LYV

I wanted to report a recent test here with the X1J Node
software on a high site.

With a callsign and the alias that is propagated with the
node list, I thought about using the dxcluster alias
capability in the X1J. Being sysop on several Nodes in our
LAN I could test it out. Sure enough I connected, added the
DXCalias as WIDE and now the node has the normal call,
normal alias for the area, and the third alias as wide which
will digipeat packets addressed v wide... So far works great.

There is even another alias for the host mode that could be set as well... I
left them on overnight to see if the node
list has the alias in it or not, it didn't last evening...

Hope this opens ideas for areas where you want (wide digi)
but do not need it propagated through the network. Several
wide in a network would cause problems if the wide is sent
to other node sites.

73 from WD4LYV Wayne in Sycamore GA

Unless someone can convince me otherwise, this is what I want to do...

73...jn

Howdy all,

Recently we made a change to the machine I run APRS on. We have three serial devices. COM1 is the mouse, COM2 is TNC and COM3 is internal modem.

I have set com 2 to use a weird IRQ. I can get Telix to talk to the TNC but one of my packet programs including APRS will talk to the TNC. Does anyone have any suggestions to get APRS to recognize COM2 using IRQ 5?

I don't know a whole lot about IRQs but normally you can use COM1 and COM3 at the same time (likewise, COM2 and COM4) Since you would NEVER use the TNC and the MODEM at the same time, I would suggest moving the internal modem to COM4

Greg:

If I understand your posting correctly, you are using a computer running APRS, weather observation equipment, and a packet modem at each reporting site.

If you don't have a need to view/operate APRS at some sites, then the computer and APRS are not necessary. PacComm TNCs (I can't speak for

other brands) will accept the weather data directly from the observation equipment and broadcast it periodically or when queried. No need for the data to go into APRS and back into the TNC...

>Did the NWS provide the equipment or did the hams provide the equipment? Just
>curious as I have seen it boyh ways.

Acutally the NWS provided the equipment, partly on my pitch that we could provide the APRS interface and partly because the precedent for purchasing just Amateur equipment had been set elsewhere (e.g. Kings County, CA). My attempts to gather funds/equipment at an ARRL Section level was difficult, despite the obvious benefits.

And getting back to my original query, I am still looking for someone who has set-up automatic stations to feed WX data to a NWS office. Specifically, I was hoping to FTP a good text file to aid in building up these types of sites around the Santa Clara Valley Section, if not further. Any of you written it yet, or will we need to scratch build the system? I'd love to write it when we've got everything up and running.

Just for reference, the practical nature of APRS has not been grasped on this portion of the California coast. I'm really hoping someone has produced the white paper that would help others starting out. I'm not sure what you meant by this, Bob:

>working and no one ever reported it as not working. A few months ago, I
>discovered that, and fixed it.

If my question was a FAQ, let me know and tell me where I can find others
without disturbing the SIG. Of course, we have not seen them on the maps
yet because we don't have APRS running yet. I was hoping that someone could
pass on some practical knowledge for others just starting out.

470. RMC & Filter Callsign

From: rkramer@vaxxine.com (Ronald Kramer)
Date: Sun, 27 Aug 1995 23:40:35 -0400
To: aprssig@tapr.org
Message-ID: <9508280340.AA29720@alpha.vaxxine.com>
Rendered body type: text/plain

Question for APR, Bob can u tell me how to turn off the the circle with the
line with the vehicle on the end on those stations sending RMC.
It shure clutter's up the screen fast, on a 4mi range with 5 second beacons
for a triathalon course the map disappears awful fast with the vehicles not
on the actual track, off screen somewhere whith a long gray line.....

Second question, I thought I saw it somewhere but can not find it now
how do you turn the C filter on without going to replay and C to remove
callsigns from tracks?

Thanks in advance

Regards, Ron ... 73 de Ron

A couple of us are working on a temp. fix for this here in Cleveland.
We are playing around with PIC microcontrollers and hope to build a
blackbox to go between the GPS and the TNC. We could then leave the
TNC in unproto mode (KPC3 now can come up in unproto by default) and have
the black box beacon positions based on speed (not distance) i.e.
beacon every 30 mins if speed < 10 mph, every 5 between 10 and 35,
every mins between 55 and 100 mph and every 15 over 100 hi hi for the
the airplanes!

I know this is not the best approach but until the firmware guys add these
features to TNCs it is a stop gap plus we are playing around with the
PICS and these seems like a good first time project.

If we are sucessful I'll post the results.

Very good, Bob- thanks. I did do a "Help Append" on this borrowed laptop and
it seems to have the command in the version of DOS on here (6.??). I hope
it is present in Dos 3.1 which i what I use on the old laptop. The later
versions are too darn big in both memory requirements and disk space
requirements.

Will try it after I return from vacation. Gotta go home today :(

Message-ID: <415t18\$12ui@usenetz1.news.prodigy.com>

Help!

The Las Vegas chapter of Tripoli -- the national association of high
power rocket enthusiasts -- is preparing to challenge the world
altitude record for high power rockets -- currently about 37,000 feet.
We need help locating plans or a schematic for a tracking transmitter,
antenna and receiver for the record attempt. Here's what we need:

The transmitter must be able to fit into a tube that is 1-1/2" in
diameter and no longer than 12 inches. It must operate for a minimum
of one hour on batteries and be as light as possible. The operating
frequency is not important as long as it is in the amateur bands. We
need a minimum range of about 15 miles line of sight. The body of the
rocket is constructed from phenolic-impregnated Kraft paper overwrapped
with fiberglass. An antenna can be glued to the outside of the rocket
body -- perhaps copper foil tape or some similar method. Radiation
pattern from the transmitter should be omnidirectional, because we have
no idea as to the position in which the rocket will land.

The receiver can be just about anything that we can carry, as long as
it is battery operated. The receiving antenna should be highly
directional and hand held.

If you have any suggestions on how I can obtain or construct a transmitter/receiver combination that will accomplish this task, please e-mail me at

UYFA59A@ Prodigy.Com

If you have any interest in being a part of this, let me know also. The attempt will be made in about 6 months, most likely in the Black Rock Desert of northern Nevada -- about 80 miles NNE of Reno.

Thanks very much for your assistance.

Wayne-

I think that is what Bill Moyers in Knoxville is doing. It works great. His X1J node is not on 145.79, though. They use another frequency that already had the X1J digi and carries normal packet traffic INCLUDING a very busy BBS. They also only had 5 or 6 APRSers the last time I was there (in June). Putting Thenet or similar nodes on 145.79 would sure cause a lot of extra traffic. Here are some observations:

1. Node broadcasts are periodically made between nodes. This propagates the nodelist and creates useless packets- since you wouldn;t use that style of operation with APRS..
2. I don't see any benefit in using TheNet or Net/Rom or any other node package for APRS.
3. Having these nodes would encourage more non-APRS traffic on the frequency, and before you know it- up pops a full fledged BBS complete with forwarding right on 145.79.

If I'm way off base here, I hope someone else lets us know other views.

I hope you don't get sidetracked into using something besides 145.79 for long- We want to see you on our map up here in the Atlanta Area. Soon!!

Ralph.

PS what is your Lat/Long, so I can put a dot on the map up here.

Paul the best thing you can do is leave the COM2 at its normal IRQ of 3 and change the IRQ of the Modem to IRQ 5 if you wish. This will also remove the conflict the modem will have with the mouse. Every thing should be OK with these settings.

Good Luck

Excellent! Yes, this is exactly what I would like to do - just run APRS at NWS and have automatic stations set up at other EOCs to beacon ground truth. It would be a hard sell to have someone construct the entire system, but with our non-profit group here in Monterey County, supporting emergency communications, we may be able to afford the cost of just the simple system you describe. Many thanks, Gwyn.

Bill,

Just a thought about your KPC-3/Magellan hookup. Try setting a parameter in the KPC-3 called PID. If it is ON then set it to OFF and try it. If it is already off then I guess this won't matter.

I had a similar problem with the KPC-3 (and the Kantronics 9612) that drove me crazy for a while as it would not recognize GPS NMEA sentences correctly with PID ON. Don't know if this will make a difference but its easy to try.

Good luck,

Dan

480. APRS RAIN & Skywarn

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 28 Aug 1995 12:36:56 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950828122916.28120A-100000@greatlakes>
Rendered body type: text/plain

A note about the automatic remote WX sensors. I believe that many stations in Indiana are using APRS for remote WX sensing... One caution about the stand -alone U-II and TNC/RADIO combo:

Since the U-II transmits a raw RAIN count, the count is meaningless unless the receiving station knows what the previous value was or when each of the two rain counters was reset. So, for remote WX sensors, APRS just displays the raw count /rNNNN. To use these in a skywarn system someone has to keep track of the raw data to see the amount of rain as each counter counts up.

When APRS is hooked up to the U-II, it ONLY KEEPS TRACK OF THE DIFFERENCE in the rain count from the time APRS was started. Therefore no matter what the rain count was when you started APRS, if you get .3 inches of rain, then APRS will transmit /R030. But since APRS also defines this rain field to be PER HOUR, this number will revert back to 0 after an hour. The PRECIP field /P030 will also show the .3 inches of rain, indicating that much rain in the last 24 hours, but it too will decay to 0 after 24 hours.

Obviously you will not be placing un-attended PC's just running APRS at your remote sites, but the simple TNC/U-II/RADIO makes a nice package. Just remember to consider how you are going to handle the rain accounting...

APR REPLY: Rather than turning off the feature, fix the problem instead. The problem is that your PC is not synchronized to real time.

Use the alt-S-GPS-TIMESYNC command. If you insist, then use the
CONTROLS-DR command to toggle of DRing.

> Second question, I thought I saw it somewhere but can not find it now

APR REPLY: Agreed. But X1J node ROMS is an easy way to get the dual alias WIDE and RELAY with a TINY-2 or other TAPR CLONE TNC...

There shuld be a way to tell the NODE NOT to send out a node broadcast, and to not permit any users, hi hi.... But be sure to set DIGIPEAT ON...

486. Re: [APRSSIG:3062] Re: extra node alias

The PicoPacket will have the provision for 4 aliases. (Thought we'd get one ahead of you, but I know it won't last).

There is less EPROM space in the TINY-2, but we can probably shoehorn most of those Alias callsigns in there too.

Less likely on the HandiPacket. It is even fuller than the TINY.

When? Within the next few weeks. We're trying to get all the new GPS bells and whistles in by the time we begin shipping the 2nd serial port model in quantity.

I asked that question of the USGS. Here is their response received today:

>
>=====Response=====

The server at "edcftp.cr.usgs.gov" had problems off-and-on most of last week and continues to be "down" today. Since you have accessed successfully in the past, it is likely that you were trying to access at the times when they were out of service. Please try again tomorrow, or later this week.

AS to placing the WIDE alias in the DXC, BBS or HOST alias position on X-1j, we did that abt 3 weekss ago. We placed it in the HOST alias position and have not seen it transmitted with the node list nor any other problems. The only major problem is the fact it is on 145.01, need to get our own network up on 79 soon, but no \$\$\$\$. Hope it helped someone. 73 Ben W55R

For the most part I agree with Ralph on this. But with some creative programming you can get 3 alias' from the X1J nodes, and turning node broadcasts off is easy with adjustment of the node parms. If you want more particulars let me know and I will look the parms up for the enitre setup. However, I do like Gwynn's comment about 4 alias' in the tiny two. Now if these Eproms will work in MFJ1274b tnc's I am sold. (Sorry Gwynn I already have several of these in use as nodes, will eventually replace them with paccom tiny 2's at the node sites.)

Gwynn, considering that most of the tiny 2's are now using the 27c512 eproms, how about an APRS specific chip that uses the bank switching of the X1J. That should give enough room for several aprs specific functions.

How difficult would it be to use that field to specify the distance
in units of 2 miles? Then you would be able to get up to 198 miles
distant. A field value of 23 would represent 46 miles. Not nice to
look at, but that isn't the objective, me thinks.

498. U-II/APRS

From: N9VJQ@aol.com
Date: Tue, 29 Aug 1995 10:17:26 -0400
To: aprssig@tapr.org
Message-ID: <950829101725_86083858@emout04.mail.aol.com>
Rendered body type: text/plain

Lessons learned from my APRS/U-II hook up:

1. Get an APRS/WX authorization #
2. Use the 5 K resistor hook-up between pins 2&3 of the Com port you're using.
3. Follow the startup prompts for second comm port, specifying WX use.
4. Insert your position as a WX reporting station
5. Plug it in and be amazed how well it works on the bench
6. Install the U-II on your roof
7. Try to make the U-II reach to your computer after mounting on the roof
8. Cross-connect, short, open, and generally foul up all the connections that seemed to work so well on the bench.
9. When everything seems to be hooked up right, disconnect the p/s and the battery from the U-II, WAIT 5 minutes (mine had the ability to "remember" the settings after I pulled the power), and re-calibrate. I must have had all the connections and APRS conditions set correctly, because after I powered down for a few minutes, everything worked great when I powered up. The "Getting WX station data" prompt must mean that the APRS program sees the info the U-II is putting out and likes it.
10. Wonder why GATED keyboard conversations about camping from GA are colliding with WX packets in IL, when all you can think about is 5 yrs ago this week the Plainfield tornado killed lots of people and caused Millions of \$ in damage, and this is why we got into APRS to start with. Oh, well, I guess that's diversity!

PS: Read \README\WX.TXT many times, especially if you're dense like me!

Rendered body type: text/plain

Disclaimer: I'm a registered, and happy, MacAPRS user.

With that said, I've got a technical question. (Hopefully, it's a simple "new user"-type question, and I can get a quick answer without taking too many lumps. ;-)

Is there any trace-type data logged when you are keeping a log file in the PC APRS program? I have some files here from the Baker to Vegas challenge cup, but they appear to have been 'sanitized'. That is, there is only location information, presumably ideal for replay-mode.

My problem is this; I want to identify what parts of the course were *directly* visible to each of the digipeater locations. That is, which parts were in good simplex range for the 25-watt mobiles we used.

The MacAPRS logs are pretty flexible, allowing us to check what types of data will be logged. So, we see all kinds of things from the MacAPRS site we had. We even see the keyboard-to-keyboard, and PBBS streams that were heard.

But, best of all, we see the via path, with the embedded asterisk, showing which device was actually heard. This has allowed us to strip these logs (manually), so we now have a log of what GPS coordinates were directly visible to that digipeater location.

Now, I need to try to derive that information for the other three locations. Is there a way? (If there are alternate files, other than the HST files, we may be in trouble, as those may not exist anymore. Still, the answer could prove to be useful for others, so they can capture that data for study.

Rendered body type: text/plain

I tried to download 1,000,000:1 DLG map files from the USGS a couple of days ago. Several persons had told me they have been successful at this. I have no problem with the 2,000,000:1 files.

The way the files are currently named makes them impossible to download to a DOS machine, as I see it.

For instance: Cartersville, GA boundaries, optional format, is about 6 files or so. Every one of the filenames starts with somethins like (and I am typing data off the top of my head here- but the pattern is right):

fo8.gdk.hjhdjh.jskjffj.jdkjfdkj.1 and on up for 6 files or so.

As you can see, a DOS machine will translate all of them to the same name: fo8.gdk
When done, you will have only ONE file, they all overwrite each other.

William Nolle says he thinks the name formats have been changed.
Anybody have any clues how to FTP these "dotty" named files to a DOS machine?

Ralph

Hi,
With the use of Heath weather computers coming along and the ability to have many of the weather parameters, it brought up a question to me, a friend in the local area is using /G000 and /H00 for gust wind and humidity, is APRS gonna support this for display? And when people put pressure in, what is recommended? In. or Mb.? I am under the impression Mb. (from the DOS version, but most pressure producing stations, show it in Inches, is there a way to specify which your using so the other user can tell? Im just curious cause these are questions that I have been wondering about.

The /G000 and /H000 are quite new, and although Bob has agreed to them, They are not implemented in his code yet. (Probably soon, but don't bug him about it..)

So far, Bob has NOT talked about supporting the Heathkit unit, but I have done this on the Macintosh.. Lets see how it works for the Mac, then I can give him the info I have gathered to make his life easier...

As far as the Pressure, we need something that fits into a 3-digit number.. i.e. /B000. One suggestion was that 30.0 inches would be /B300, but that gives us a range from about /B290 to /B320 or what-ever, so I think there are better ways to do this.. Suggestions?

Since the pressure range would be 25.99 to 34.99 (maybe?) then you could drop the leading digit and have 600 be equivalent to 26.00 and 400 be equivalent to 34.00 -- the software would *know* which leading digit to include.

Keith

Try doing it the way the manual weather report encoding does it: use the last three digits, including the single point decimal, in millibars. Thus,

852 = 985.2 millibars (stormy)  
285 =1028.5 millibars (fair)

There should not be any ambiguities; the lowest a barometer gets is around 960, and the highest is around 1040. And a tenth of a millibar precision is plenty good for resolution. Isobars are always plotted in millibars nowadays (usually at 4mb contour intervals) instead of inches, even when temperatures are plotted in fahrenheit.

How about using millibars, if greater than 1000 subtract 1000. This would give greater resolution, and should be little chance for overlap unless reporting pressures from high altitude balloons... say 500 to 999 is direct, 000 to 499 is minus 1000.

There are several "gotchas" associated with the 1:100k DLGs. the absolute best way is to get them via the CD ROM route, if you've got a technical or university library readily available.

The files are out there in unix compressed format, as well as being offered in two file formats: STANDARD and OPTIONAL. The only one you want to grab is the OPTIONAL. Adding insult to injury, the files are not CR/LF delimited so you will either have to have acces to a unix box, or do some low magic on the PC to reblock the files. There is a shell script for the unix-inclined that's in

It would seem practical to try to determine the coverage holes for a number of sites. (This helps you determine if you should use the site the next time, or pick another site.) I guess the only good way to do this now (in APRS) is to save a bunch of screen shots. But in a networks (using any relay or wide stations), the picture is only of that network, and not practical for determining individual coverage. Maybe I'm missing something here...any other ideas?

I suppose we just set up a second TNC and computer, to run TRACE to capture logs.

Perhaps we try to borrow a bunch of Macs? :-)

Would there be good reasons \*not\* to request that this be a future enhancement to APRS? (Or should it maybe be an option you can choose to turn on or off?)

Just some whimsey, as I ponder moving and adding a few digipeaters along a 120-mile desert-and-mountains race course.

regards,

N6UOW David K. Z. Harris

Ron, I cannot speak for other weather stations, but the manual entry form for weather requests pressure in tenths of millibars, ie: 08.8 is 1008.8 millibars...anything over 50 is in the 900's...ie 55.2 is 955.2 mbs, and hopefully, you have the windows shuttered...hi hi.

I almost always append the free text of the beacon with the barometric reading in inches for those less scientific minded persons...ie...  
Baro 29.92 R, 29.93 RR, 30.02 S....using the standard meteorological codes of FR Falling Rapidly, F Falling, S Steady, R Rising, RR, Rising rapidly.

The same can be done with winds....ie 250@03G12....

Jack, if your barometer ever gets down to 25 inches, I hope you have a  
spacesuit...the lowest barometric reading ever recorded at sea level was  
26.97 inches of mercury in the center of Hurricane Gilbert.  
  
BTW...lets not forget the plan for National Hurricane Center to use  
readings from APRS....they must have the readings in millibars.

You'll probably get multiple answers. Most ftp clients I have seen will  
allow you to rename the file you download, i.e...  
  
ftp>get file\_with\_a\_non\_dos.name file1.dos  
  
try that...it makes getting more than a few files a chore, but a least  
you get them.

Actually, Hurricane Gilbert had the lowest pressure ever recorded in the  
Atlantic Basin. The lowest sea-level pressure EVER recorded was in  
Typhoon Tip (October, 1970) at 870 mb (25.70 in). I agree with Kevin,  
though...pressures that low are extremely rare. It's important to note  
that some of the extreme arctic cold air masses commonly have pressures as  
high as 1045 or 1050 mb, and the highest ever recorded at sea-level was  
1084 mb (32.01 in) in Siberia...again extrememly rare conditions.

APRS already extracts data from NWS hourly summaries and uses their convention for barometric pressure, which is to take the last 3 digits in millibars. for example 998 is 998 millibars. 033 is 1033 mb. There can never be a 1998 or we are in deep trouble...

Thanks Bob..

I guess I should have been able to figure that out, but was not sure on the details.. I will use the /Bxxx where xxx = millibars, /B998 or /B033

Keith

My word on Barometric Pressure, should be since the Heath only reports to the  
nearest millibar, and that most NWS reports use the last 3 digits i.e  
(pressure currently at my place is: 29.93" or 1013 millibars) and should read  
/B013 so you have your range of /B950 to /B050 and you know when to add the  
trailing 1 if the number is between /B000 and uhm /B200 (to be on the  
safe-side) and what I think the weather display could look like from a Heath  
report i.e.: 200/011/T091/R000/P000/B013/G012/H69

-----  
Temperature 91 F  
Wind Data 11 MPH from SSW gusting to 12  
Barometer 1013 Mb  
Humidity 69 %

Hr. Rainfall    0.00" / 24 hr total:   0.00"

-----  
I am not really sure about the rainfall to display both, maybe use 2 lines, but the NWS data will show dew point, and I think if a station is pulled up showing dew point /D000 instead of humidity, substitute "Dew Point" for "Humidity" and not use the % sign. Maybe use a "F" instead?

I was thinking we could show a wind direction vs bearing? SSW means more to me than a 200, personal opinion, we could easily define

N        348-013  
NNE    013-31  
NE      031-058  
ENE     058-73  
E       073-102  
etc.... I would need the calculator to figure the exact figures...  
Anyone else have input?

Actually, do we NEED to have 3 digits for humidity? I haven't seen many places where humidity gets reported as "100%", even when the temp/dew point collide.

As for baro, use inches, drop the leading digit and the decimal point, and you have the standard aviation format - 000 = 30.00, 992 = 29.92, etc. This is what I gathered APRS is using anyway, from the documentation!

There is also an aviation standard for reports in milibars, which is to not use decimals, and only the last three digits. 985 = 985, 025 = 1025. In aviation reports, for stations that report both inches and millibars, the millibar report is one of the last things on the line.

Why play Microsoft and invent a new standard, when good, usable ones already exist? B-)

## 531. An APRS specific eprom for TNC's

From: moyers@ibm.net  
Date: Thu, 31 Aug 95 00:05:39  
To: aprssig@tapr.org  
Message-ID: <9508310718.AA0044@localhost>  
Rendered body type: text/plain

After reading resent posts about more alias's, beaconing periods, and weather data involving tnc's. How about  
lets start a wish list of APRS features for a APRS SPECIAL EPROM. For the most part the 256 eprom's used the  
most tnc's is getting full, and to get around this the author of the X1J series of node software started using  
27C512 eproms for his code. This helped alot by giving him much needed room to add more code by bank switching the Eprom, and is an easy mod on most TNC's (Paccomm tnc tiny2's have this mod already.)

That said, and after reading Bob's reminder about tnc/wx stations beacon raw weather data with rain given in  
a value for the last 24 hours got me thinking. If we could convince one of the tnc programmers to write a  
APRS tnc eprom to parse this data into per 1 hour increments instead of 24 hour increments. Shouldn't be to  
hard and makes more sense to do it at the tnc than it would be to have aprs attempt it from remote data.

Makes even more sense than having an operator watching every weather beacon durring a disaster logging the  
data down at every beacon just so we how much rain has fallen in the last hour.

ARE THERE ANY MORE SUGGESTIONS FOR THE WISH LIST?????

For the past year or so I've been running a GARMIN GPS50 in my van with an  
EPSON notebook computer and an MFJ TNC and the hardware single port mode of  
APRS. Since I went to a much smaller vehicle, there is no room for the  
computer. The GARMIN GPS50 hooked directly into the KPC3 with version 6.0

firmware (two wires, brown to pin 2, black to pin 7 of the serial port) works great! I miss seeing the computer screen, however, and wonder if anyone has interfaced a palmtop to APRS (I can probably find room for that)? Also, are there any finished or kit APRS to Doppler DF system interfaces available that share a single com port with the GPS and TNC? 73 - Bill WB3V

>high as 1045 or 1050 mb, and the highest ever recorded at sea-level was  
>1084 mb (32.01 in) in Siberia...again extremely rare conditions.

However, why design a program that may not cover an extreme? If you know approximately where the extremes are, then cover them with a little extra room. I guess I would have to recommend 25 to 33 (because I like even numbers 32.5 if you don't care) based on the info I've seen.

Yes, I've run one of the earlier version (62C) of APRS in a single port mode with a 2 meg HP100LX palmtop. The screen is a little squished and the maps take forever to load, but otherwise works fine.

I ran APRS from raw dos on an "A" drive PCMCIA card and feed the GPS through the serial port. I forget if you need a null modem on the serial cable. I have enough room for the laptop, or I set up as a stand alone tracker, so I only set up the Palmtop some time ago to see if it would work. It did. Don't know if the newer, fatter versions will fit in memory. My configuration is 650k memory with about 580k free to run APRS in raw DOS.

>If we could convince one of the tnc programmers to write a  
>APRS tnc eprom to parse this data into per 1 hour increments instead of 24  
>hour increments.

I second that, and I also would like to see the ability to use a single port laptop in mobile WX situations, just like the HSP switch allows for GPS use. Then a person could use a APRS/U-II combination in storm chasing or Hazmat situations. Or even better, combine a U-II/GPS to spot one's WX reporting position automatically.

Why should GPS get all the fun? :-)

I have a working Doppler to aprs interface but a VER 2 from N7LUE is coming. If I were you I would wait for that. Bob was working on a second switch DFSP that is needed in addition to HSP for single port Doppler-TNC-GPS. It appears to need some minor work still, I have it working with a doppler and GPS but haven't tried a TNC. There is also a problem with APRS plotting the doppler headings relative to north instead of the vehicle heading. Bob has been distracted by meteor scatter WX etc. where it appears more people are interested

## 540. APRS Docs

I have this general problem with Shareware Docs, and APRS is no exception. When I try to print out the documentation that comes with it, it is a mess. Weird line breaks, characters, and all sorts of funny business. Cleaning it up is a major chore.

Does anyone have a nice, clean set of APRS Docs that I could either pay for repro and postage for a copy of, or an electronic u-Soft Word version that I might (probably won't) be able to make a clean print of?

Subject: APRS Port Switch

If You Have Difficulty Getting the APRS Port Switch to Work

There are two common problems to look for: The unit is not getting power or the GPS signals are at too low a level.

Use a voltmeter to determine if there is DC Voltage coming in from either the PC connector pin 6 or the TNC connector pin 6. If not, check for another pin on the PC or TNC which can provide 6-12 VDC and change the cable wiring accordingly.

If power is not available from the PC or TNC, then a 9 Volt battery may be connected to supply power between Pin 6 (+) and Pin 5 (-) of the RS-232 (PC) connector. This is also a good way to get the unit operating initially after trouble is experienced.

The other most likely cause of problems is inadequate drive in the positive direction from the GPS receiver. In some cases, DTR is always a little too high and this is the next most likely cause of trouble. The circuit works only on positive going signals. The GPS data output is fed through a 1k resistor and must have adequate drive capability to get at least 0.7V on the base of transistor TR3 in order to turn it on. This is normally the case, but SOME GPS receivers don't seem to do this. Adding a 4k7 resistor between the data input and pin 6 of either the TNC or computer port of the adapter should provide enough pull-up to make it work. The series 1k resistor on the GPS input cannot be lowered in value because TR4 is used to hard clamp the data and would short circuit the GPS output.....

DTR is used to switch the circuit between data sources. This needs to go at least 1.2V POSITIVE when the circuit is in the TNC mode. On some computers the low state was still too high and would cause

TR4 to remain turned on all the time, thereby preventing any GPS data to be gathered. A simplistic fix to this was to add a second diode in line with DD5 and thereby drop 0.7V. A better fix would be to vary the value of RD9 up a little.

Troubleshooting is performed by using APRS in HSP mode. Select Operations-Comm.-TNC to see TNC data (O-C-T). Select Operations-Comm.-GPS to see GPS data (O-C-G). A future APRS release may contain a simple toggle feature while in the O-C window to allow fast switching between TNC and GPS data. In the meantime, use O-C-T O-C-G , etc. to switch over.

Revision History for PacComm APRS Port Switch Units.

ECN 97 11/30/94: Add a 1N914 diode in series with D7 to work better with GPS inputs that have minimal negative voltage swing.

ECN 103 3/13/95: Connect Pin 6 of the TNC connector to Pin 6 of the PC connector to provide an additional source of supply voltage for computers with no wiring to Pin 6. PacComm TNCs provide +5 VDC on pin 6.

ECN 104 3/16/95: Change RD8 from 1k to 4.7k to improve TR2 switching reliability.

I agree that the extremes should probably be covered. My point was just to clarify the extremes. 870 mb and 1084 mb are extremely rare. However, you may see 1040 or 1045mb a couple of times a year in the Northern Plains during winter. I remember an air-mass over Alaska a few years ago that was close to 1070mb.

In standard hourly weather observations, the NWS DOES report sea-level pressure to the NEAREST TENTH of a millibar, using only the last three digits (e.g. 025 is 1002.5 mb, 989 is 998.9 mb). And on National Meteorological Center synoptic surface charts, that's how it's plotted. I expect that's why APRS reports the pressure that way. Since many of us are using APRS in NWS offices with SKYWARN and other programs...it's nice to be consistent with the way NWS reports things. In cases of extreme pressures (either low or high) you can always figure out whether or not to add the leading "10" or "9" (or "8"??) just by looking at the weather that's occurring. If there's a hurricane, you know that the pressure is low...if there's an extremely cold arctic air mass, you know the pressure is high.

I always hated Acrobat ... nice idea, but it takes up so much space on the

As far as ENTERING the Barometric pressure data, for Manual entry, I will allow the entry of EITHER millibars, Inches, or whatever anyone says makes sense, with the computer automatically converting between the different formats..

What we need to decide on (!SOON!) is what gets transmitted over the air.

Bob has already said that he transmits /Bxxx where xxx = millibars, however, in the recent discussion, some people say this is NOT sufficient, i.e 3 places of accuracy. So, I will ask my question again..

Given the format /Bxxx What should the 'xxx' be?

In the Mac version, I can easily handle 4 (or more) decimal places, but the PC version will probably have problems with that, so lets try to keep it to 3 places..

Keith

I'm not having much luck with APRS and Windoze 95.  
I'm currently running the ancient APRS 6.6 incantation  
which adds to the challenge. Here's what happens.

1. When APRS is in full screen mode, everything works perfectly.  
I do not have an msdos mouse driver loaded, so no mouse.

2. When APRS is running in a window ( alt-Enter ), aprs is  
apparently running. All the letter and number keys work fine,  
but not the cursor pad or PgUp/PgDn. The display is a perfect  
640x350 dot box on my 1024x768 screen.

3. When APRS is running in a window, the priority is apparently  
low enough that the usual beeps are sometimes extended to extra  
long tones. This seems to be controlled by whether the APRS  
window is the "active" (mouse inside) window.

4. The Windoze 95 "System Monitor" shows that APRS probably  
has a "spin loop" that consumes CPU cycles waiting for input.  
Kernel processor usage runs 100% with APRS active.

5. Shoving APRS from full screen to the "Task Bar" ( alt-Esc )  
results in APRS going comatose. Input is apparently buffered  
in the TNC as switching to the foreground results in a buffer  
flush.

This is about all I've done with my limited testing.  
More later.

I think you should have HC winds up to about 150 mph which is very usual. I agree that if you can;t do it any other way, do it in increments of 2 miles. I agree with Jim, K4GVO

All wind SPEED fields in the hurricane report are 3 digits.

THE QUESTION WAS THE RADIUS OF HC FORCE WINDS? Do HC force winds extend beyond 99 miles from the center? I AM allowing 3 digits for the range of TROPICAL STORM FORCE winds..

The DSP-93 sig has covered the use of Acrobat in some detail.

It is one of the few cross platform "Free" software doc readers.  
It has worked well when text and graphics are needed in a publication.  
Post Scripts is still needed for CAD circuit diagrams.

Yes there are some conflicts with other items but :

The only (MAC) extensions necessary is the control panel device "ATM-LE 3.8.2"  
I don't use ATM so I just have the start up manager do a one time load for  
those few times I need Version 2.0.1 of Acrobat Reader.

The Fonts are only 360K of disk storage and don't use main memory when  
not used. The program is 746K and will fit on a floppy.

WINDOWS environment (L.J.Shepherd) said:

"The installation of the reader was straightforward in the  
WINDOWS environment The extra time spent with this new reader was worthwhile  
and would seem to present a nice alternative for those with laser or bubblejet  
printers."

Ron W5RKN said:

"you can get acroread.exe at ftp.adobe.com in  
/pub/adobe/Applications/Acrobat/Windows. Its 1405k and worth every byte.  
Let's not give up on pdf until someone comes up with a common,  
free substitute."

>From sci.geo.satellite-nav newsgroup:

\*\*\*\*\*  
FAA to Upgrade GPS  
\*\*\*\*\*

The U.S. Federal Aviation Administration has awarded a \$475 million  
contract that will enhance the accuracy of the Global Positioning  
System (GPS) satellite navigation system, reports Matthew L. Wald in  
the Aug. 4, 1995, New York Times ("A Contract Is Awarded To Improve  
Navigation," p. A7).

The contract calls for construction of 36 ground-based  
reference receivers which will compute the positional errors in the

reference receivers which will compute the positional errors in the  
system and transmit that information to a central office. This  
correction factor then will be sent via geosynchronous satellite to  
GPS receivers which will use it to establish their locations more  
precisely. Officials hope the system will be operational by the end  
of 1998.

> Navigation," p. A7).

This refers to one POTENTIAL implementation of the Wide Area Augmentation  
System under review. The actual method of distribution, while it might have  
been stated in the contract award, is not finally settled and there's still  
some pretty significant discussion of how to distribute and how to control its  
integrity. I'd take a wait and see attitude to determine if WAAS will aid us  
in the sort (or even long) term.

Color me skeptical.

The answer is yes. I believe Felix had hurricane force winds extended  
out to 120 miles at one point? It certainly can happen and I would think  
you would want the program to be able to cover all of the possibilities.

## 11. Ver 73a announcement

From: Bob Bruninga <bruninga@nadn.navy.mil>  
Date: Fri, 1 Sep 1995 18:43:24 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950901184139.12273B-100000@greatlakes>  
Rendered body type: text/plain

Ver 73a finally posted. Includes WX, MScatt and SPACE mode changes:

- \* Added optional WX symbol definitions for the existing lettered circles  
Drizzle, Rain and Snow Showers, Haze, Lightening, Smoke, Dust(sand)  
Blowing snow, Freezing rain. See WX commands
- \* Hurricanes, Tropical Storms and Depressions shown in Red, Yel and Blue
- \* Wind radius shown for these storms if exact format is followed
- \* Manual DF Bearing now works for mobiles. See DF.txt
- \* Added MScatt receive mode and sender has choice of timing sector
- \* Faded objects no longer Dead Reckoned. Leaders also fade
- \* Dots command added for replays to force all symbols to small dots
- \* New MASTER/SLAVE mode for commercial applications using networked computers. One master has TNC/RADIO, but all slaves can see the data.
- \* Ver 73a added HSP toggling using F8 key while in the O-C-T mode

Ver 72d: Mods for Meteor Shower

- \* Forces FADE off in MScat mode so you can see posits over 2 hrs old
- \* BText no longer limited to 3 chars in MScat mode
- \* CONTROLS-XMT command now works in MScat mode
- \* Fixed MScat mode for Kantronics TNC's so that BEAM heading and Pwr show up
- \* alt-A ALL-CALL-PREFIXES now works in all modes, not just DXcluster
- \* In MScat mode now TNC FULL-DUPLEX is enabled so all locals transmit at same time vice consecutively for collision avoidance

## 16. APRS Mobile GPS DFing

From: Bob Bruninga <bruninga@nadn.navy.mil>  
Date: Fri, 1 Sep 1995 23:26:31 -0400 (EDT)  
To: aprssig@tapr.org  
Cc: fox-list@netcom.com  
Message-ID: <Pine.SUN.3.91.950901231035.12667A-100000@greatlakes>  
Rendered body type: text/plain

With the latest APRS version 73a, I'm finally satisfied with the handling of the GPS heading and RELATIVE DF bearings.

Although APRS supports the automatic interface to Doppler DF's, the real advantage or 73a is that it works very well manually too. All you have to do to enter a DF bearing is hit the keys I-D and the RELATIVE bearing. APRS computes the true DF bearing based on the GPS heading and plots the bearing on the map from your present position, EVEN WHILE MOVING.

If you want to SAVE that posit and bearing on the map permanently, just press I-S. If you want to UPLINK it to other APRS stations on frequency simply press I-U. To make sure you get a GPS posit at the same time you are getting a good DF fix, the F8 key will force an immediate posit update from the GPS...

Even if you dont win the hunt, your track history replay will be impressive...

---

## 17. OMNI DF-ing

From: Bob Bruninga <bruninga@nadn.navy.mil>  
Date: Fri, 1 Sep 1995 23:49:57 -0400 (EDT)  
To: aprssig@tapr.org  
Cc: fox-list@netcom.com  
Message-ID: <Pine.SUN.3.91.950901232639.12667B-100000@greatlakes>  
Rendered body type: text/plain

I don't think I knew of the FOX-LIST back when I finished all of the OMNI DF capabilities of APRS. So thought it was time for a re-hash of this new and very powerful DFing technique that can be used with ANY RADIO and ANY ANTENNA!

APRS plots all stations on a map. Knowing the stations antenna height above average terrain, APRS also plots the relative radio range of each station. With this minimum information, a fox or jammer can be located to within a neighborhood in seconds. EVERYONE can participate including mobiles, HT's, etc. NO SPECIAL DF EQUIPMENT IS REQUIRED.

As soon as the fox or jammer begins transmitting, everyone quickly switches to the input and notes the signal strength. NULL REPORTS are VERY VALUABLE!!! Ninty five percent of the statinos will NOT hear the fox, but these null reports represent everywhere that the fox is NOT! APRS draws BLACK circles around every null report, out to each stations radio range. Usually, this eliminates 95 percent of the entire metro area immediately. For stations that do hear the fox, APRS plots a colored circle inversly proportional to reported signal strength.

The BLACK circles overlap the colored circles and further eliminate areas. The area of the intersection of the brightest colored circles not blacked out by null reports is the probable location of the fox!

This technique should increase the number of DF participants by TWO orders of magnitude! First, because NO DF equipment NOR directional antennas are required. HT's, mobiles are excellent. SECOND, the omni DF technique is over and done in the first 5 minutes of a fox hunt. This lets dozens of stations to participate from their arm-chairs who do not have time to spend the whole day trying to pinpoint the final location of the fox. The purpose of this technique is to localize the area of a fox or jammer QUICKLY. THEN let the DF mobiles find the house and insert coax pins as needed later.

APRS also supports the fade-circle techniqe which can be used by a single omni mobile. He just drives around and preseses F5 everytime he is in an area of EQUAL signal strnegth. After 3 such points, APRS can compute a circle with the fox at the middle. The omni mobile drives to the center of that circle, inserts attenuation, and does the process again. Eventually with enough attenuation, and smaller and smaller circles, he arrives at the fox!

To see examples of these techniques, load the APRS backup files and REPLAY files: DF-OMNI, DF-FOX, AUTODF, DF-FOX1, 2, and 3.

P.S. This OMNI DF can be used AFTER THE FACT also. If every repeater organization would just designate a few APRS stations to collect position reports and jammer reports, a profile can be built up over time localizing the position of the jammer. The bottom line is that every mobile operator simply needs to understand the importance of the REVERSE button on his radio and HOW VALUABLE A NULL REPORT CAN BE!

You don't have to shout. I was just suggesting that you had a field  
of 2 characters and that it was possible that this field may contain  
a number greater than 99. All I suggested was if that was the case,  
you could extend the range of a 2 digit field by using the number to  
indicate units of 2 miles rather than one. Forgive me for living.  
Sheesh.

What would be nice is if the APRS standard allowed us to append a  
character to the wind speed and other reports to remove the abiguity -  
on the output of the Heath weather station, it gives the unit of  
measure being used, and a revised APRS standard could take that into  
account.

Example: Heath Wx station wind report is "w015M030D", the average wind  
is from 030 degrees at 15 MPH. "w015K030D" means 15 knots, and  
"w015L030" means kilometers per hour.

Example: Heath Ex station barometer report is "B3015", barometer is at  
30.15 inches. "B1013M" means 1013 millibars.

Proposal: Assume the "old standard" reports are in MPH and INCHES for  
wind speed and barometer (knots for RMC fixes). Introduce NEW standard,  
which will, unfortunately, break older versions, that allows M for Mph,  
K for Kilometers per hour, and N for kNots in the wind speed field, and  
I for Inches, M for Millibars in the /B barometer field.

Alternative proposal: Have a /U (for Units) field, which specifies  
what units are being used, as in /UMI means MPH and Inches, /UKM is Kph  
and Millibars, and /UNM is kNots and Millibars. This doesn't break old  
APRS versions, because they don't parse beyond the rain field, anyway...

---

My philosophy has been that units characters are wasted characters. There is no need to have multiple transmissions standards. What this means, is that everything is transmitted in only one unit, but on receive, the APRS software should give you a CHOICE in display units.

I finally got around to giving the Centigrade option. Now with the MacAPRS Heath interface giving barometric pressure, I guess I will have to give an inches/millibar option. But the on air value will only be one. That leaves more room on our very short comment field.... hi hi

WHAT version of 73a? there is the full up system, APRS73A and there are two upgrade files 72ato73a.zip and 72cto73a.zip. Which of the 3 did you get?

> really dont get out much. One even operates a indoor station !

WIDES should be WIDELY separated! Tell them to read the DIGIS.txt file.  
It used to be that a lot of WIDES were needed to cover low power mobiles.  
BUT NOW WITH DUAL ALIAS TNC's, EVERY WIDE SHOULD ALSO HAVE THE ALIAS RELAY.  
THIS way, EVERY APRS STATION ON THE AIR INCLUDING THE WIDES ARE RELAY's  
and therefore every LOW POWER mobile should go via RELAY,WIDE etc. There  
is no longer any excuse for having WIDES anywhere but on the very best  
VHF locations and WIDELY distributed.

## 27. Hurricane format ARGH!

From: Bob Bruninga <bruninga@nadn.navy.mil>  
Date: Sat, 2 Sep 1995 13:55:22 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950902133859.13694F-100000@greatlakes>  
Rendered body type: text/plain

Well, the new format of 73a looked fine on my machine, I couldnt wait to  
see the crop of hurricanes out there start popoing up when KD4UYR began  
using the new format. BUT..... I forgot one thing... The <UYR> gets  
appended to the end of all OBJect reports and that overwrites the last 5  
characters of the report! ARGH! APRS was going to use those characters  
to plot a range circle around the hurricane showing the radius of winds...

So instead of figuring out a way to gain one more character for the HC  
wind radius, I now have to find an additional 5 more!

APRS overwrites the suffix of the senders call on all OBJs: <UYR>

EXISTING FORMAT: ...LAT/LONG@CSE/SPD/HC/120^140mph/0978/out33&150

NEW PROPOSED FORMAT...LAT/LONG@CSE/SPD/HC/120^140/978>033&150 <UYR>

Here I have left out the MPH and the OUT identifiers and now the  
> symbol will indicate the radius of hurricane force winds and the  
& symbol will indicate the radius of tropical storm force winds

Now I have one question. Do they really measure sustained winds and PEAK  
winds? Or is the PEAK wind always a fixed ratio above the sustained?  
If it is a constant, then there is no need for the PEAK winds to be  
transmitted, since we can calculate it based on the sustained winds,  
and pick up 4 more characters...

In reply, I would suggest that all exchange of signal reports in df  
situation involving jammers take place on the telephone.

Our DF group in Indianapolis has had many situations when a person  
without a call using a stolen rig was about to be found but some well  
intentioned ham started talking about the situation.

We never discuss jammers on the air. Always use the phone. That should be  
in the instructions for APRS.

If people have to discuss jammers on the air, and exchange signal reports  
relating to jammers or intruders on the air, the DF operation would be  
better off without that "Help".

Malicious operation is increased, not decreased, by any mention on any  
frequency, where the bad operator, or his buddy, may be listening.

Loose mouths help the bad guys and feed their ego, keep discussions about jamming and the like on the land line.

Of course, stuck transmitter are a different matter.

### 30. APRS Mobile GPS DFing

13: [1;33;42mRainbow V 1.19.3 for Delphi - Registered

73 de Kevin KD4UYR

> in the instructions for APRS.

If you have a jammer with a stolen HT who can 1) determine what frequency APRS is being used on in the local area, 2) decode the 12 byte or so 1200 baud ASCII string that has DF information in it just from listening on his stolen HT while he jams your repeater then I'd say you'd better leave that dude alone, or better yet, get him licensed!

Part of the beauty of APRS is that since its a different modality from most jamming its pretty tough to know you're being surveilled by the local foxhunters.

If you just have FM repeaters available, I'd agree: Keep the info channel confined to the telephone, however APRS is certainly secure enough for the random kid/hood/whatever that is intruding. Try it; you'll like it!

Rendered body type: text/plain

I was relieved when I looked at my screen later tonight and saw the colored storms in the atlantic AND the wind radii just as I had intended despite my previous message! My previous message was a little frustrated since the new format I had defined for the hurricanes radii was defeated by the <xxx> overwritten on every OBJ!

It turns out that KD4UYR solved the problem for now, by just dropping the Peak winds and MPH so that the line is short enough so that the radii are not affected. Thanks! This will get us through this hurricane season without me having to make another release.

The only thing that 73a looks for is the TYPE of storm (HC, TS, or TD) and the letters "out" so it can find the radii... The rest of the format was only a suggested format. The long term fix will be as described in my previous message so that we continue to get peak winds and central pressure.

Rendered body type: text/plain

I think our messages are crossing and are "out-of-sync"... Ron Kramer thinks I had a problem with the download... no I didn't, but Bill Knolle did... seems the "full version" filename of APRS73A.ZIP (200K) was corrupted but the other two files were ok as I downloaded 72AT073A.ZIP without any problem.

I wasn't sure whether APRS73A.ZIP was supposed to be a full version of maybe just the executable, but at 200K, I knew something wasn't right so I elected to get one of the other files... guess I'm glad I did! All this was from tapr.org's ftp site.

Anyway... 7.3a is running like a charm here and I like the new weather features. Thanks all again... hope this puts the file download topic to bed!

Bob B says he doesn't like unit characters. OK, I can live with that. I can even live with going to a 100% fixed-format, with no "parse characters", such as the /Tnnn and /Rnnn prefixes, so long as it is documented.

If the APRS standard for pressure is to be millibars, and speed in knots, I will modify my Heath scripts to convert to those - while it will automatically display such if I ask, this particular unit is being used at our ESDA, and they don't want knots and millibars...

But, again, we need to lock it down as to WHAT the standard is, before we can start conforming to it.

Hi, Bob,

Thanks for the explanation. I have a question. I've got a PK-900 that will run two ports simultaneously like the kam plus. I looked through the docs and didn't see how I might be able to use it on 2 and 30 at the same time. It works ok for receiving but obviously sends on only the manually selected channel.

If you don't support it and want to, I'll be glad to furnish you with any technical info that I have.

Thanks,  
Jim.

> characters", such as the /Tnnn and /Rnnn prefixes, so long as it is  
> documented.  
>

I have no problem with NOT having the UNIT characters, However, except for the CSE/SPEED, I insist on PARSE characters, there are too many things popping up that may or may-not be there with different systems to NOT have this..

Currently the list includes

CSE/SPD No Parse Chars (Same fields are used for RDF, and moving objects)  
/Txxx Temperature  
/Rxxx Current Rain  
/Pxxx Rain for last 24 hours  
/Bxxx Barometric pressure (units still under discussion)  
/A=xxxxxx Altitude  
/Hxxx Humidity, max = 100, left at 3 chars for sanity  
/Gxxx Wind Gust

With some of the other weather stations being supported, I expect this list to grow some.

Bobs software expects the data to be in a certain order, which my software produces, the same order, but my Parse routines will actually handle it in any order it comes in, it will also handle any number of characters, not just 3 like Bobs.. Again, my software ONLY transmits stuff with 3 chars to stay compatible with Bob...

Bob, can any of these be used to upgrade APRS 7.2d? The APRS73a file isn't large enough to be the full program and you dont have a 72dto73a file.

Thanks in advance

Mark de N9WST

Rendered body type: text/plain

As ARRL SEC for SNJ, I always encourage ARES ECs and their county staffs to provide what their served-agency officials want and not what we think they want. By the same token, I would suggest that we, as APRS'ers, sit back and think of whom we are going to provide the weather reports to and what or how they want it... then strive toward that end.

I think Bob (APR) had a resonable approach in that a standard "sentence" or string be sent over the air and let the APRS receive end do any conversion necessary to provide any "served-agency officials" the info in the format they want it to be in.

The other alternative might be to determine what the majority of the "served-agency officials" want and code it that way without any conversion choices. ^^^^^^

Just a thought!

### 45. Rag Chewing on APRS

From: [N9VJQ@aol.com](mailto:N9VJQ@aol.com)  
Date: Sun, 3 Sep 1995 12:02:58 -0400  
To: [aprssig@tapr.org](mailto:aprssig@tapr.org)  
Message-ID: <950903120257\_90198201@emout04.mail.aol.com>  
Rendered body type: text/plain

I seem to remember from the documentation that APRS is not designed for ragchewing. This seems logical, as the APRS packets are not going to anyone in particular, so if they get blocked by a QSO, the sending UNPROTO station won't send it again. However the QSO station keeps sending the same message until it gets ACKed.

This didn't pose a big problem until more and more APRS stations came on

freq. Now we've got stations advising other stations to put GATE in their UNPROTO path, so DX stations can hear them.

I think what did it for me was a station in GA conversing with a station in AL about camping. It's nice though that packet puts the sending station's callsign on. We can find out who's ragchewing.

Can I ask that we all (me too!) restrain from using APRS to conduct live conversations?

Thanks and 73's  
Barry Leonard N9VJQ

## 46. APRS73A.zip problem on ftp.tapr.org

From: n4uls@ix.netcom.com (Jack Anderson )  
Date: Sun, 3 Sep 1995 09:20:38 -0700  
To: aprssig@tapr.org  
Cc: bruninga@nadn.navy.mil  
Message-ID: <199509031620.JAA14609@ix6.ix.netcom.com>  
Rendered body type: text/plain

There may be a problem with the full 73a file on the TAPR FTP server.

I noted the following when I check the /tapr/SIG/aprssig/upload listing for APRS73A.ZIP:

```
-rw-rw-r--  1 404      402      236032 Sep  1 23:06 aprs73a.zip  
          ^^^^^^
```

For a full release file, sizes of less than 1 megabyte for the zipfile are unusual. I have not tried to run this yet.

## 48. APRS HF GATE

From: wnolle@ro.com (William Nolle)  
Date: Sun, 03 Sep 1995 15:38:34  
To: aprssig@tapr.org  
Message-ID: <199509032044.PAA04802@sh1.ro.com>  
Rendered body type: text/plain

Well it looks like we are discussing HF Gates again hi hi.  
Well so far it has manages to just about kill all possibility's of building aprs in North Alabama. It has gone way out of hand, If is used as intended it would be great, but all i see is HF Gaters using the Bulletin function for sending messages back and forth. I think Barry N9VJQ may think APRS cannot or should not be used for keyboarding, well if it's kept locally and don't do as some that use WIDE,WIDE,WIDE like W7LUS in GA then that is not a big problem at all. We have done this many times by just going trough our digi and nowhere else, I don't mind telling you that i'm to a point where i'm going to exercise my right's as having the only coordinated digi site in the southern states it looks like to use it for other things then strcitly APRS. My coordination papers say Packet activity this of course includes keyboarding Barry!. I have seen activity go down from seeing 30 or more users to 3 or 4 lately. We had good intentions to build APRS in this area for community service (Specially weather) but this is being ruined by Gates and users throwing up uncoordinated digi's just wherever they feel like throwing up one. So the result may be just a great keyboarding digi for North Alabama. I hate to be a party pooper but don't want to let this coordinated digi site go by the wayside, i worked to hard to get it in the first place. The thing i'm saying if we as APRS users don't organize we are going to kill it ourselves either with gates or those people that feel they don't need to coordinate anything including digi sites. I had an old timer tell me that flat out "i'm going to do what i want to do, nobody is going to tell me different. Well with that i will get off of this horse again and i'm sure i will be receiving a

lot of flack for this posting but fellows i can take it, I have been through enough in my lifetime that you don't have to feel bad at all to throw it at me good or bad hi.. I know i will get lots of it from Georgia "Hi fellows\*.

That is a problem. No one should be putting GATE in their path unless they have darn good reason to do so. It wasn't a problem on a special event like Field Day ... the APRS network provided a neat way for FD stations to show they are out there. For every day use it is a problem.

> Can I ask that we all (me too!) restrain from using APRS to conduct live  
> conversations?

We do a fair amount of ragchewing on VHF APRS around here and no one really complains. The key is to change your unproto path to the shortest necessary. We use it during Skywarn as well as other times. The ragchews aren't usually long or drawn out but there doesn't seem to be a problem around here with the APRS users ragchewing with the "S" function.

The really great aspect of ragchewing in APRS is the fact one can have several on going separate conversations easily.

> conversations?

APR REPLY: Good question.. You will notice that APRS no longer has that nagging prompt about using APRS for ragchewing. These days, along the eastern seaboard from Va to New York we have pages of stations on line, but the only QSOs i see are usually from the HF gate... Actually, if I don't see any chit-chat, I wonder if it is working...

So I personally don't mind reading the mail. What I think the lower activity means (along our 15 digipeaters) is that more people are using a PATH intelligently selected to keep their messages local or point to point instead of everything going everywhere....

I removed the NAG about not using APRS for rag-chewing, back when I added the DIGIPEATER list and therefore the ability to have a DIFFERENT path

for messages than the BROADCAST path used for POSITS. I think the only caution I would still have is just common sense and courtesy: Use a message path appropriate for the QSO. Even if that is across the state, that seems OK by me as long as the channel is not saturated...

Does anyone want to do a STATISTICAL NETWORK ANALYSIS of APRS throughput compared with a connected packet? Recognizing that it is poorer, it sure is convenient to carry on long protracted simple QSO's without being stuck to the keyboard and time-out timers....

So, I have kinda softened my concerns over QSO's...

I agree that arps can be used instead of the phone to exchange info about stolen transmitters. The thief will probably not know about arps. When it comes to jamming, it just depends on whether or not the jammer, who is presumably a ham, is on arps or has a buddy on arps. However, using arps instead of the phone means just using arps and not sending packet messages that anyone with packet can read or talking about it on the air to get everyone on arps. I suspect in most cases there will be a lot of loose talk on voice frequencies as soon as arps starts in. Again, arps is fine, but it cannot resolve the location into a solution, and must be used so the arps users do not let the cat out of the bag.

If we had better arps maps of Indianapolis, it would be possible to use it at base locations for beam-heading plotting. Most of the df group is not on packet, so we will not be using it except at un-connected stations with beam headings exchanged over the air (stuck transmitter) or on the phone (jammers and stolen transmitters.)

Arps and GPS on a balloon have only once lead to the balloon being found after it burst and came down on a chute. The other launches resulted in considerable df work to find the package as the balloon was still in the air when the transmissions dropped out of sight. The one launch that did not need a df crew to find the package was the result of the location being known because of a GPS packet downlink and a plane being in the air and able to spot the package in a field!

I think that arps will be of help in df situations. Now if I can only get a good indy arps map!!

Too busy on transmitter id project ( if any of the beta testers ever actually build the A/D converter! ) to do a map myself.

Again, with stuck transmitters and jammers, be discrete.

Malcolm WA9BVS

Rendered body type: text/plain

Hello all. I run the WIDE area digi here in Pinellas County Florida. As Paul, KR4YL mentioned in a earlier post, we use APRS here for ragchewing on the VHF side alot. There has not seemed to be a problem with overload by local stations here. The problem I do have is stations not using the correct digi path when engaged in a ragchew. Stations on vhf should only use there local digi and not wide,wide,.... if only ragchewing with other local stations. Stations on hf, if ragchewing with another station on hf, should drop ALL GATES in there unproto path. This has caused the most channel overloading in this area. Please remove your GATE from the unproto path when talking on HF. For your beacons and bulletins gating is great, but not for ragchewing.

Demos

APRS and MacAPRS do NOT!! work with the DeLorme CDs. They won't release the information to their CDs therefore we cannot use it..

We do however, support the \$32 CDs from the USGS.

CAREFUL. APRS works with Delorem ONLY to the extent that you must let APRS be a front end COMMS system for APRS. But APRS has the ability to send out its serail port a NMEA position report that looks like it came from a GPS. If the Delorem running on another PC will accept GPS input, then it will display SINGLE posits "hooked" on APRS...

The Wisconsin and Peoria IL Balloon groups have used GPS on the balloon and APRS to track it on a NUMBER of occasions. WITH GREAT SUCCESS TOO!

A few other groups that I have heard of use the GPS/APRS combination too.

When working GPS is on board, the DF is usually used as a backup and not primary. It has also resulted in friendly competition, who can find it first, the GPS/APRS trackers or the DF guys.. This really puts some pressure

on the DF guys...

The first balloon launch that I attended, the GPS/APRS was heard until the package was about 1000' above ground, we copied this from a distance of 30mi.

We went to within 3 miles of that last-known position and immediately picked up the signal again, then we followed it right in, only problem was that there was a River between us and the package and we had to go about 10mi one way and 10mi back to get to the other side of the river.. As it turned out, the package had landed within feet of the river.

Also, MacAPRS has a bunch of the features from BallTrack (WB8ELK's Balloon prediction program) built into it to PREDICT where the balloon is going to go BEFORE it is launched.. The accuracy of this is quite good IF the wind data from the FCC is current and entered properly.

## 58. MFJ-8621 Data Radio

From: "Jeff Brenton [SDFORUM]" <76703.1065@compuserve.com>  
Date: 03 Sep 95 23:13:11 EDT  
To: <aprssig@tapr.org>  
Message-ID: <950904031310\_76703.1065\_CHN71-2@CompuServe.COM>  
Rendered body type: text/plain

Sending this via my CompuServe account, just for convenience. On the same pass this is posted, I'm E-mailing MFJ about a problem I'm having, tuning the MFJ-8621 to operate on the "standard" APRS frequency of 145.790.

History:

In mid-May, I placed an order for three MFJ-8621 data radios, to be crystallized and tuned at the factory for 145.030 and 145.790. 10 weeks and several phone calls later, a package arrived, one day AFTER I left for a week's vacation.

The package contained TWO of the 8621s I ordered, crystallized for 145.010, and two sets of crystals - one each for 145.030 and 145.790. After I got back from vacation, I tried to set the radios up, following the MFJ tuning procedures.

The short version of the story is, the radio tunes very easily, provided you are crystallizing it for something very close to 145.010; i.e., the 145.030 crystal set works great. Unfortunately, that can't be said for trying to swing it to 145.790!

Transmitter swings fine, although the frequency tolerance of the crystals MFJ supplies is suspect - the 145.790 transmit crystal was over 10kHz off, and the 145.030 crystal was about 5kHz off. Both were within the range of the transmitter's adjustments, however.

Receiver tuning is unlike anything I've used before - after you tune the transmitter for the correct output frequency, you attach a voltmeter to the discriminator test point, then key the transmitter. You then adjust a coil until you get 2.50 vdc on that test point.

Worked fine for the 145.030 crystal set, but, neither radio will approach 2.50 vdc with the 145.790 receive crystal installed, unless the signal is removed; this with the subject tuning coil adjusted through its entire range. Closest it comes is 2.85 vdc, with the tuning slug removed. I am waiting to get ahold of a service monitor to try adjusting things the old fashioned way...

This radio does not come with any schematics, which makes it all the more difficult to decide what I'm fighting here. I have built Hamtronics kits with no problems, but these things have been incredibly frustrating. I \*will\* defeat this problem, but it's been a PITA!

---

## 59. New APRS73a upload

Rendered body type: text/plain

I just FTP'ed another copy of APRS73a.zip. Hope this one sticks...  
It's the same one as before, but people were reporting that it didn't all make it last time. It shows as 111?,??? K this time although on my DOS machine I think it shows as 109?,??? something...

Rendered body type: text/plain

I was kinda burned out after the 4 day Persieds APRS event. A total of 19 stations heard a total of 18 stations on 2 meters. All on paths of several hundred miles with most between 600 and 1000 miles. Here are some clean-up after thoughts....

- 1) I assume that we had fun, but that 4 days was too long. No future event on 145.79 should last more than 24 hours... Maybe 2 big 24 hour events twice a year.. Other minor shower events could be acceptable as long as operations were between MIDNIGHT and 0800 local? (the optimum MScatt period anyway) (comments?)
- 2) I don't see any way to use any other frequency than 79 and have any chance for minimum QRM and FLACK from other band users. Is it worth trying to find one? Who can spearhead this effort? What about 144.49 when the Shuttle is NOT IN ORBIT? 144.79 when shuttle IS in orbit?
- 3) Do we wait till December for the next one?
- 4) APRS73a distribution (ARGH! but not the upgrade files... nuts) contain the file MSCATTER.BK so you can see a plot of those stations heard. REMEMBER you can REPLAY a BK file without having to LOAD it by just typing the full file name MSCATTER.BK at the REPLAY prompt. APRS will see the .BK instead of .HST and automatically look in the BAKS directory instead of the HST directory. This lets you look at a BACKUP file without LOADING it...
- 5) One station reported that 73a does NOT transmit MScatt mode on the OPTIONAL schedule other than the 4 defaults.. Anyone else confirm this?
- 6) Who wants to be the RECORDER for future MScatt events. That is, collecting the reports and summarizing the data... (not me...)

Rendered body type: text/plain

Gee Bob, nice of you to have asked.

As it turns out, I am in the process of conducting a study of packet

characteristics on various frequencies accessible by my station.  
It doesn't directly address the question of rag-chew vs no rag-chew,  
but does provide some data about channel usage.

I've recorded the packet activity for a 24 hour period at various  
frequencies and tabulated the data by frame types. Here are some  
preliminary results:

| DATE   | PACKETS | RR   | RN | UA  | UI   | I    | C    | D   | DM | RJ  | FRMR | Freq.     |
|--------|---------|------|----|-----|------|------|------|-----|----|-----|------|-----------|
| Aug 22 | 1791    | 758  | 16 | 41  | 3    | 919  | 31   | 14  | 4  | 5   | 0    | 145.07MHz |
| Aug 24 | 2887    | 0    | 0  | 0   | 2885 | 2    | 0    | 0   | 0  | 0   | 0    | 145.79    |
| Aug 25 | 10505   | 6335 | 0  | 153 | 314  | 2126 | 1009 | 386 | 29 | 153 | 0    | 14.095    |
| Aug 29 | 6329    | 1185 | 2  | 100 | 1569 | 2150 | 1211 | 73  | 11 | 28  | 0    | 144.93    |

Frequencies 145.07 and 144.93 are local ROSE sites with pbbs activity.  
145.79 is used exclusively for APRS traffic. 14.095 is the popular  
20 meter pbbs location.

Equipment used is a PK232 TNC. VHF antenna is a Ringo at 15'; HF antenna  
is a ground mounted trapped vertical. Traffic in each case was recorded  
via the loggin channel for approximately 24 hours. The data was then  
processed using an original program written in Pascal. The process yields  
the results by callsign, with totals and percentages. I've abstracted  
only the totals for presentation here.

William Manley KB4XE

I hate to take up bandwidth for this because it has been said before. I  
can't, however, find where I had saved the information.

Can someone EMAIL me the configuration for wiring the GPS-40 to a DB-9? I  
have the pinouts of the GPS plug as: brown-data out, white-data in,  
black-ground. I have a DB-9 listed as: pin2-receive data, pin3-transmit  
data, pin5-ground. So does the brown go to 2 or 3. I can argue it either  
way. Do any of the other pins need to be connected? I will likely try  
some stuff in the meantime, but I would like some confirmation.

I also would like to know if anyone has successfully provided external  
power to their GPS-40. If so, how did you do it? The plug I have has four  
pins but only three wires coming out. Is the remaining wire the one I  
needed?

Chip Griffin - President of Thames River Apple Users Group

Rendered body type: text/plain

Is it possible or can the program be made to tag a trace and move that whole trace from one location to another the same as you do individual points on a trace. Shuch as the border of a lake is a full trace and it is say 10 miles too far north and east of where it should be once the map is drawn. Just tag any point in it and move that point to the new location and the whole lake moves. Move the one point and add or subtract the movement from the rest of the points in that trace.

Thank in advance

Regards, Ron ... 73 de Ron

## 65. HSP Timeout Problems

From: Michael Walker <mwalker@gold.interlog.com>  
Date: Mon, 4 Sep 1995 18:19:25 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <199509042219.SAA13157@gold.interlog.com>  
Rendered body type: text/plain

I have been having a problem with v7.2c, PK88 (on 30m HF Mobile), AEA HSP cable, and a new NEC Versa 50 laptop. At some random time and event (and I have tried over the last 15 hours to nail it down), the port will time out when it goes to retrieve data from the Garmin 45. The PK88 will receive commands, but it doesn't appear to send any back to the computer, and I do not receive any GPS data.

If I do a O C T to talk to the TNC, I get no response. I get 1 cmd: prompt and then it refuses to listen or respond.

>From then on, the com port is not usable until I enter a modem program like Telix or Windows Terminal, hit enter once then exit. APRS will now load and run fine until the next hang.

I haven't confirmed it, but I think the problem is with the laptop. The question is, has anyone else had inconsistant problems with the serial port?

Replies greatly appreciated.

(If anyone was wondering why I kept disappearing while 30m mobile in Northern Ontario, you now know the reason)

Many thanks in advance...

Mike VA3MW

Rendered body type: text/plain

My laptop will crash if I select F7 HI RES mode with version 73a. I noticed that it only occurs while in SPM mode. (I think) But SPM has nothing to do with display changes... So is anyone else out there having F7 HIREs problems? If so, what exact config of APRS are you set up for... Other than that, no significant problems found with 73a. Trivial on the fix list are as follows:  
\* I gotta change the F-C comment on the 1st map for new users to M-C  
\* I want to make Altitude scale selectible in 3D mode  
\* Fix the spelling of my name on the REGISTER.DOC!  
Maybe its time for me to make another stab at the mouse...

[good, but previously-seen-here-stuff deleted]

> I suspect in most cases there will be a lot of loose talk on voice  
> frequencies as soon as aprs starts in. Again, aprs is fine, but it cannot  
Not necessarily. The aprs guys around here are pretty stealthy, and as  
soon as a problem occurs, maybe a phone call or two goes out, but nobody  
running aprs ever gets on a voice repeater to talk about it. They're  
busy plotting the solution.

> resolve the location into a solution, and must be used so the aprs users  
> do not let the cat out of the bag.

If you mean solution as in "resolution to the problem", true. That's  
always the \_next\_ step. I thought it was Marion County which had made  
hams "special deputies" or some such title. Since some of the repeater  
users were used for special police business [S&R, disaster relief, etc]  
then anybody jamming the repeater was interfering with equipment that  
the deputies used for their special police business, and locally its a  
crime to interfere with police business. Presto, send out the Sheriff  
and forget the feds!

>  
> If we had better aprs maps of Indianapolis, it would be possible to use it  
> at base locations for beam-heading plotting. Most of the df group is not  
> on packet, so we will not be using it except at un-connected stations with  
> beam headings exchanged over the air (stuck transmitter ) or on the phone  
> ( jammers and stolen transmitters. )

Hmm. Maps apparently aren't all that hard to make, maybe I can talk a  
local mapmaker into whipping one out for you to start on. I don't have  
a plotter or a CD-rom, so I can't say if they're easy or not! I do have  
some gps data for Ft. Wayne, however, if you know anyone up there that  
could use it.

> Too busy on transmitter id project ( if any of the beta testers ever  
> actually build the A\D converter! ) to do a map myself.  
Gee, that sounds familiar! :-)

>  
> Again, with stuck transmitters and jammers, be discrete.

ALWAYS good advice!

>our digi and nowhere else,

Bill- Bob APR and LUS know each other, maybe Bob can give LUS some  
pointers on how to keyboard with other HF users on APRS without propogating  
a one sided conversation thru the whole VHF network, too. I do notice the

problem, you speak of. Not having a KAM, I don't know whether LUS can shut off the output on VHF when he's just concerned with the HF QSO. Maybe Bob can intervene.???

I don't mind telling you that i'm to a point where  
>i'm going to exercise my right's as having the only coordinated digi site in  
>the southern states it looks like to use it for other things then strcitley  
APRS.

Whoa- there. Alabama is in its own world when it comes to coordination of anything. Especially repeaters. The coordinating body for the SouthEast except for AL and FL is SERA. They do not, however, coordinate packet. They do recognize and support a packet coordinator. In GA, that is WA4MEI, Randy Jarrett. If you are going by the ARRL directory, you'll see that SERA sent no packet info to the League. SERA and the packet folks are working together now (joint attendance at the last 1 or 2 board meetings). As I understand it, very soon the SERA journal and the ARRL directory will have the packet listings as well.

If you have questions concerning COORDINATED packet in the rest of the states near you, please contact Randy before making unfounded statements. There are quite a few others than yours.

Randy can be reached at : wa4mei@radio.org

>My coordination papers say Packet activity this of course includes  
>keyboarding Barry!. I have seen activity go down from seeing 30 or more  
>users to 3 or 4 lately.

I still see the same # of users. Maybe even more.

We had good intentions to build APRS in this area for  
>community service (Specially weather)

I REALLY appreciate the hurricane updates from Kevin in FL coming out on HF. Just as I appreciate the severe thunderstorm and tornado info from Northern Alabama!

but this is being ruined by Gates and  
>users throwing up uncoordinated digi's just wherever they feel like throwing  
>up one.

Where? and uncoordinated in WHOSE book?

So the result may be just a great keyboarding digi for North Alabama.

## 73. Millibars et al

From: jeff.brenton@espi.com  
Date: Mon, 04 Sep 95 23:21:32 -0500  
To: aprssig@tapr.org  
Message-ID: <9509042321.0WTCJ0B@espi.com>  
Rendered body type: text/plain

OK, folks, I decided to do some research on the aviation reports of sea-level pressure, as it relates to what we've been discussing as possible standards for APRS. Here's the text from the Airman's Information Manual on the subject:

Pressure Recorded in "Millibars."

The mercury barometer reading at the individual weather stations is converted to the equivalent sea level pressure and then translated from terms of inches of mercury to a measure of pressure called millibars. One inch of mercury is equivalent to approximately 34 millibars; hence, the normal atmospheric pressure at sea level (29.92), expressed in millibars, is 1,013.2 or roughly 1,000 millibars. The usual pressure readings range from 950.0 to 1,040.0. For economy of space, the entry is shortened on some reports by omitting the initial 9 or 10 and the decimal point. On the hourly weather report, a number beginning with 5 or higher presupposes an initial "9," whereas a number beginning with a 4 or lower presupposes an initial "10." For example: 653 = 965.3; 346 = 1034.6; 999 = 999.9; 001 = 1000.1; etc. If the fourth element in the aviation weather report is sea level pressure coded 132, this is decoded 1013.2 millibars.

Individually these pressure readings are of no particular value to the pilot; but when pressures at different stations are compared or when pressures at the same station show changes in successive readings, it is possible to determine many symptoms indicating the trend of weather conditions. In general, a marked fall indicates the approach of bad weather and a marked rise indicates a clearing of the weather.

[and, later:]

SEA LEVEL PRESSURE: Sea level pressure reported in millibars follows the visibility or weather and obstruction to vision in the Surface Aviation Weather Report. It is transmitted in three digits to the nearest tenth millibar, with the decimal point omitted. Sea level pressure normally is greater than 960.0 millibars and less than 1050.0 millibars. The first 9 or 10 is omitted. To decode, prefix a 9 or 10, whichever brings it closer to 1000.0 millibars. The following are a few sea level pressures that are decoded:

| AS REPORTED | DECODED          |
|-------------|------------------|
| 980         | 998.0 millibars  |
| 191         | 1019.1 millibars |
| 752         | 975.2 millibars  |
| 456         | 1045.6 millibars |

So, using /B132 is 1013.2 mb (standard pressure), equivalent to 29.92

If millibars is to be the standard, I'll modify my Heathscript to convert the inches currently being used to millibars, and start broadcasting that. Are we going to go with 3 digits, as is found in aviation reports, so we can use existing aviation "SA" reports to supplement measurements made by APRS stations, or 4, so that we can cover a wider range than normally used by aviation?

## 74. BBBeeps

APRS BEEPS-OFF was intended to remove all BEEPS that were not initiated by the user. (So he could sleep by his PC and not be awakened... hi hi) It does not suppress BEEPS in response to user inputs, which alert the user to his actions. In your case, the beeps are telling you that your outgoing message buffer is FULL and that APRS is ERASEing the first message in the buffer (WHETHER IT HAS BEEN ACKED OR NOT) to make room for your continued input. If you have several outstanding messages to others, you may NOT want them automatically erased... Therefore the beeps...

## Page 1081

>

I have modified and combined a BUNCH of stuff for the balloon tracking, and although I use his basic Idea, I do NOT use any of the code (its in BASIC).

I would, however, be interested in getting a copy of your modified stuff.. BTW, I am doing this with WB8ELKs knowledge and permission.. But as I said before, I am NOT using his code directly, or as far as that goes, even indirectly... I also am getting some parachute data from the military, however, the guy that promised it to me has yet to deliver..

The WIND data is from the FAA, not the FCC.. And a pilot just called up some number and got it... It actually is on the Internet, but in an almost unuseable form... There are some graphs showing this stuff, but I can't find the actual raw data..

There is another program up on TAPR called PacketTracker that does a lot of 'network' analysis for ANY type of packet data, it shows percent utilization, packets/hour, and other stats..

Its also shows a logical map of which station (and type of station) is talking to who, showing lines between stations indicating where the packets are going. It shows dotted lines when the re-trys get above 10%, and a lot of other neat info..

This program was presented in a paper at the Tampa DCC two years ago. It was written by my brother, Mark Sproul, KB2ICI, and of course, it runs on the Macintosh.. If you are interested in seeing what is going on, it is WELL worth the effort to get the program and go visit somebody that has a Mac and a Packet station...

> Is it possible or can the program be made to tag a FEATURE and move that

> whole FEATURE from one location to another the same as you do individual  
> points?

NO. SOMETIMES WHEN THE WHOLE MAP IS OFFSET, I COMPUTE THE OFFSET NEEDED  
IN BOTH THE X AND Y DIRECTIONS, AND THEN WRITE A PROGRAM TO ADD THOSE  
OFFSETS TO EVERY POINT IN THE FILE. YOU CAN SEE THE RAW POINT VALUES AT  
THE BOTTOM FEW LINES OF THE SCREEN IN MAPFIX.

YOU COULD OBSERVE THE OLD AND NEW VALUES FOR A POINT, AND THEN USE A TEXT  
EDITOR TO ADD THESE OFFSETS TO ALL POINTS IN THAT FEATURE...

Rendered body type: text/plain

Hi Bob!

Just wanted to drop you a line to say how much I like your APRS software.  
I have one question about the registration cost. Does the \$24.00 cover  
the cost of the registration and the latest version on a disk or do I  
have to kick in an extra \$9.00 for that disk. Please let me know so I can  
decide on which I would like to do. Thanks for your help and 73's.

Dan Tassell

There is always the option of grabbing a DUAT briefing and decoding the winds  
aloft from that... Talk to your pilot about that for an idea.

Bob,

Did you write APRS? If so where did you find out about  
info on the NEMA standard that most gps's use to communicate??

I've wanted to add a gps to my df setup for some time now but this  
has always been a limiting factor for me.

thanks,  
-jason

## 81. Re: [APRSSIG:3201] HSP Timeout Problems

From: dwetzel@acs.uswest.com  
Date: Tue, 5 Sep 1995 08:57:21 -0500  
To: aprssig@tapr.org  
Message-ID: <04c503a0@acmspgw1.mnet.uswest.com>  
Rendered body type: text/plain

I have been having a problem with v7.2c, PK88 (on 30m HF Mobile), AEA HSP  
cable, and a new NEC Versa 50 laptop. At some random time and event (and  
I have tried over the last 15 hours to nail it down), the port will time

out when it goes to retrieve data from the Garmin 45. The PK88 will receive commands, but it doesn't appear to send any back to the computer, and I do not receive any GPS data.

If I do a O C T to talk to the TNC, I get no response. I get 1 cmd: prompt and then it refuses to listen or respond.

>From then on, the com port is not usable until I enter a modem program like Telix or Windows Terminal, hit enter once then exit. APRS will now load and run fine until the next hang.

I haven't confirmed it, but I think the problem is with the laptop. The question is, has anyone else had inconsistant problems with the serial port?

Replies greatly appreciated.

(If anyone was wondering why I kept disappearing while 30m mobile in Northern Ontario, you now know the reason)

Many thanks in advance...

Mike VA3MW  
mwalker@interlog.com

Although I don't have GPS up, I have the same kind of problem with vhf, a PK232, with a 486 clone desktop machine. I usually run APRS full screen under windows and wondered if that might be causing the problem, but I haven't really done a lot of research as to other possible contributing factors.

Message-ID: <9509051819.AA07597@wpdis01.wpafb.af.mil>  
Rendered body type: text/plain

Greetings to the SIG,

I have recently moved to Dayton OH from the cradle of APRS, Annapolis MD, and I'm 90% settled in to my spacious government quarters, hi hi. I know it may seem a bit early and I don't have many contacts yet; however, I am a volunteer to do what I can to prepare for any APRS events the group may want to consider for next springs Dayton Hamvention. I will be happy to work forward logistics or assist if necessary with an existing POC. Like most of you my first responsibility is to work and family and I travel occasionally but I am available to assist with such a worthwhile project. Please do not contact me for hotel/motel accommodations and the extra beds in my house are spoken for by hams from Maryland, Michigan, and Idaho. I realize these limitations rule out 95% of what some of you had planned to ask for, but I'm here if you need me.

My number is listed, but I'd prefer we correspond via e-mail.

de WB8CXN

Rendered body type: text/plain

I am not too hip on the AEA 232.  
Went to a buddy and told him all about APRS. Tried to run it on VHF on his AEA and zip...nothing...

It kept saying " >NO disconnected "  
and wouldnt monitor stuff..  
HAD mon set to 1 thru 6

Also, MCON kept switching from 1 to 0 ??

What do I do ?

Again, Im pretty handy with MFJ and KPC but never had an AEA.

One other note...Seeing alot of comments on the HF ragchewing that comes through the VHF nets. Would really have to agree with most of the comments directed to ...WATCH your DIGI PATH !!! When I qso, I set the minimum digi path...HF operators should do the same ? Right ?

73 to all...hope the hurricane dont hit us !

## 86. DR - WARNING!

From: paul@paccomm.com  
Date: Wed, 06 Sep 95 09:40:52 UTC  
To: aprssig@tapr.org  
Message-ID: <5213@paccomm.com>  
Rendered body type: text/plain

Found an interesting bug in APRS that needs an urgent fix.  
When I used an earlier version a few weeks ago to track Erin,  
I very successfully predicted the position and time where it  
was (probably) going to be - I was within 25 miles after a prediction  
that was made 24 hours before! (a testament to the stability of  
the track of the storm too .....)

What I did was take the SOG and COG, enter the object into APRS  
and then put the real time clock forward on the PC. Then restart  
APRS and look at where it said the TS would be at the "new"  
time.

I just tried this with v7.2 with Luis and found that the total  
track over the ground is wildly wrong! With 9 mph set as the  
SOG, after 10 days it still has only covered about 300miles!

If you watch it in real time all seems OK, it's when you come  
back and reload the file much later that you find wild errors.

i.e. the longer the time span the worse the slowing down of the  
storm is.....

This needs two fixes: get the DR working right again as it  
must be true for ALL objects.

An ability to run time forwards & backwards in a "what if"  
scenario.

As I said, you're at the mercy of the storm in it's COG, but  
this years storms seem to have hit a track and stuck to it  
when coming over Florida.

Another interesting observation. A friend of mine has kept  
storm tracks on a piece of paper for years. When I  
saw this I remarked to her that the curves followed some  
pretty re-producible tracks (with some obvious exceptions, of  
course). This was more a feature of the projection used, on a  
"normal" map/chart the curves were not obvious.

Worth pursuing? Maybe. With some "bending" algorithms (like  
was was done for the 3D mode) maybe APRS maps could work in  
different projections and give us some more potential for  
working with our friends at the NHC .... :-)

Gunna be interested in the new WX features when 73a is OK on  
the tapr server....

>was returned!

Your messages are making it to the SIG just fine. I'm getting the POSTMASTER messages too. One of the SIG users used to be at that system, and apparently is no longer there. The destination system is bouncing all mail for that user, including messages from the listserver. Our host or administrator needs to delete the bogus address from the SIG mailing list.

The verification messages from TAPR are routine and not related to the POSTMASTER problem.

73,

Jack

It is amazing that some folks with bad servers/providers get dropped from the sig all the time, but this stupid redriver nonsense has been going on for weeks and the listserv still hasn't dropped that name. Maybe because redriver is sending its bounced messages back to the aprssig rather than to the listserv itself?

Will someone PLEASE ask the admin of the TAPR listserv to purge this guy's address?

Asking the HOST will not work, I already tried asking Mr Sproul, but he informed me that he was merely the Host of the group and had nothing to do with the list. Someone MUST know the way to reach the person in charge of the list.

Bob Bruinga's e-mail address is [bruninga@greatlakes.nadn.navy.mil](mailto:bruninga@greatlakes.nadn.navy.mil)

If you have messages or questions about your registration number or other semi-private messages, PLEASE send them directly to him at the above address.

Same goes if you have this type of questions comments for me regarding the Macintosh version of APRS.

But please do NOT send them to the entire list. We are having several people drop off of this list because it simply gets too many messages in a day.

Lets try not to clutter the sig with messages that really should be sent to an individual.

Keith Sproul

APR REPLY: APRS only DR's for up to 24 hours. Beyond that, it truncates the time delta to 24hours. Thats why it worked for a one day DR, but not for a several day DR. I thought about putting FUTURE-TIME DR capability, but figured that that should be left to the hurricane plotting programs which have built in the probable paths and usual forces on the track...

This is a function of a bad address or lost user at Kennedy Space Center. It's not getting lost! Not to worry, eventually we'll track down the offending parties and get that one fixed.

> The same day, I received a message from TAPR asking if I wanted to stay  
> current on the SIG.

That's a periodic check to EVERYONE to make sure someone who doesn't know how to unsubscribe (more folks than you'd think) can get off gracefully, and to ferret out bad E-mail addresses... Like the one at KSC. It's a ListServ service to you to periodically check and see what you'd like to do.

> So, If this message makes it to the SIG, please let me know if any of you are  
> still waiting for  
> replies from me that never made it. Thanks and sorry for whatever delay is

Your mail was not (apparently) going into a hole. Or, if it was, it was a failure at AOL... something that has occurred with some regularity in the past

Anybody got a list of ftp sites for wx related stuff?

In particular, hurricane tracking and prediction (?).  
Also, Web sites fer future reference.....

>From where do I download the new version of APRS?  
I have been unable to get into the APRS or Software Library WWW pages of TAPR for two days. Is it unavailable or am I having some other problems? I am assuming the new version is available there. Is it available somewhere else?  
Thanks  
GBohner @aol.com

## 99. Lesson learned, GPS, KPC-3 and HSP mode

From: wjh@ideas.com (William J. Howard)  
Date: Thu, 7 Sep 95 12:55:36 EDT  
To: aprssig@tapr.org  
Message-ID: <9509071655.AA13110@ideas.com>  
Rendered body type: text/plain

The Garmin GPS-50 and the KPC-3 worked swell in the car, but I missed the laptop display. Put the laptop in the car along with a Hardware Single Port (HSP) cable, switched the KPC-3 from GPS mode to terminal mode, and that worked swell also. But I noticed a few extra packets going out. The KPC-3 was still sending some of the packets from the GPS mode along with the data from the HSP mode. The lesson learned is to set all the KPC-3 BLT commands (1-4) to EVERY 00:00:00 when using the HSP mode. There problem solved.

Now the thought occurs, wouldn't it be nice to have multiple POS/RATE and UNPROTO commands available in APRS.

Here is the scenario. A VHF APRS mobile, to provide a good track, beacons at least every minute or two. If a few VHF mobiles beacon that often and include GATE in their UNPROTO path, the HF links would be overwhelmed very quickly. if on the other hand the VHF mobiles had a POS/RATE of, say 60 seconds for the UNPROTO path of RELAY,WIDE,WIDE and a POS/RATE of say 300-600 seconds for an UNPROTO path of RELAY,GATE,WIDE it would allow more effective use of the system.

The additional POS/RATE, UNPROTO paths could also be used very effectively for covering a wide area on VHF when you happen to be in the middle of the pack. Say for example one UNPROTO path could be set for a string of North bound WIDES (by specific callsign) and the next UNPROTO path could be set for a string of South bound WIDES (by specific callsign) or East or West depending upon your location. This would also help prevent the problem of using the path WIDE,WIDE,WIDE and having the packets fold back into the first WIDE on the third bounce.

Try this link, a lot of hi-res WX graphics, very complete, and very frustrating on slow modem connections.

Rendered body type: text/plain

Well, not really, and I dont understand all of the web stuff, but if I could have a copy of APRS save out a SCREEN.GIF file snapshot of the screen say, once an hour or so, is there someone who then can make the electrons automatically suck that into their web site? Then web browsers could check your home page and see a CURRENT map.

If someone can tell me what the .GIF format is, then maybe I can make APRS copy out a map in that format... Well, I assume that I can probably find the details on the .gif format here, but if I am overlooking something, please lemme know.... Or would a .PCX format be better? I was told by someone else that WEB sites like GIF files...

On Monday, someone posted the phone number of a BBS (in Florida I think), as a beacon on 30M. It had something to do with gathering NMEA data and using it for Mapfix (at least so it was inferred).

Did someone copy the phone number of the BBS?

cheers...mike

Keith just gave us a great 3 Hr. workshop on APRRS.  
We had both Mac & PC versions running. There was a HF gate via the van from the parking lot and several mobile trackers. I hope you'all saw us.

We took a break for dinner and went at mapping applications until 11pm.

The conference room was full !!. This is just a quick report.

Message-ID: <Pine.3.07.9509090847.A2675-c100000@acme>  
Rendered body type: text/plain

I remeber when I first fired up the APRS program 2 years ago with version 2.05. The maps were crude and covered large areas with little or no detail. Then we had the orginal mapfix to work off of just to check to see how they looked, no editing or lableing capabilities, and were limited to 999 points and 99 line segments (crashed many a map by exceeding those limits.) With those maps, at a 4 mile range, if a vehicle tracked close to the road, we were extremely happy. (A lot of those maps are still in use, and will probably never be updated.)

I've spent a few hours over the last week to determine how accuarte the different mapping schemes are. .02 mins here, .04 mins there, oh my.. .05 mins. Then it dawned on me, I was at the .125 mile range, and those little gray or red lines themselves should be at least .01 min wide, if not more. And how accurate are the GPS unit's we are using without DGPS, .02 to .03 mins. (A path of a tornado can be up to .5 mins wide.)

For a long time I thought that fewer map points were best (quick redraws, cleaner lines, etc.) then I got tied up into the CD-ROM and found myself trying to squeeze a 2 mile range map in under 3,000 points. I created my own monster. The last map that I did had 2795 points, and took my 386dx-40 4 second to redraw, (I hate to see what it would do to the poor old 8088 laptop w/lcd screen that I use for mobile ops) it it replaced a 990 point map that was there in about 1 second.

So what's my point. - How accurate do these maps need to be ? Does anyone care if they are 1/16th of a mile off at a 4 mile range? Doe we really need to zoom in to the .0625 mile range (I've gone down as far as .03125 mile range.) I want to throw it out for open disscussion - Normally us map makers rarely hear back from the users, (when we do it's "gee, my gps unit shows that the road I live on should be moved N and little when I zoom down to the .xxx range). Are you folks willing to give up speed for accuracy, do you really care about a road being 50 ft off, (if your using the program to autonavigate your car, I want named on you life insurance policy). Remember folks - the map that we use (USGS CD-ROM's) are at a 1 cm on the paper equals 1 kilometer in the dirt.

O.K., I vented, I feel better, now lets see, which #@\$&^(\*!! map was I working on.....

## 110. Garmin GPS-45 DataIN

From: W2H0B@aol.com  
Date: Sat, 9 Sep 1995 20:18:30 -0400  
To: aprssig@tapr.org  
Message-ID: <950909201827\_95420459@emout04.mail.aol.com>  
Rendered body type: text/plain

My Garmin GPS-45 outputs 3vdc which is sufficient for my various computer serial port's RS-232. However, since my computer ports all output 12vdc, I'm wondering if I should put in some limiting resistors or use a zener diode or some such so I can have the computer talk TO the GPS. I want to try downloading some of the stored waypoints using the comm program I got from the tapr.org ftp site.

This could've been mentioned in the APRS docs... I don't remember seeing it though... are there any suggestions or caveats?

Thanks for the help.

It's Datums , and It doesn't matter.

Most of the maps you see are based on USGS 1:100,000 mapset, which are NAD-27 (North American Datum - 1927) and to quote the USGS  
"To place on the predicted North American Datum 1983, move the projection lines 2 meters south and 17 meters west."  
Where is Atlas when you need him?

> If its not a Border Collie,  
> its just a dog.

### 113. How to set Unproto

From: GBohner@aol.com  
Date: Sun, 10 Sep 1995 12:46:55 -0400  
To: aprssig@tapr.org  
Message-ID: <950910124650\_95775806@mail06.mail.aol.com>  
Rendered body type: text/plain

I am going to be cruising the Caribbean and want to use APRS to do position reporting.  
Due to the distance, I will probably just use HF on 10.151 mhz.  
What is the correct way to set unproto so that other HF stations will digipeat my signal. I do not think it is practical to select one station since I will be moving around alot. Also, some ocean crossings take 12 hours or more and the skip would be changing.  
Some local APRS users suggested setting it to: gate,wide/wide,wide but there seems to be considerable confusion on this topic.  
Thanks in advance for any help.  
If you see a signal in a few weeks coming in from Trinidad, off the coast of Venezuela, that's me.  
Guy Bohner, W6LJL, GBohner@aol.com

REPLY: In general, you don't want other stations digipeating on HF.

> Some local APRS users suggested setting it to: gate,wide/wide,wide

APR REPLY: I assume this is for a KAM or other dual port TNC? If so, then that is a good setting. The path of gate,wide on HF is the nominal default. It will allow all gateways to relay your position onto VHF.

Garmin's tech svc dept advised me that "their" cable is straight through.

I was the originator of the first "Non-Garmin" serial cable. I originally used Bob's little pull-up resistor scheme. After finally finding out from Garmin how their cable was wired (I wasn't about to spend \$140.00 for their cable and program), I simplified it and posted the cable diagram here and on my FTP site.

If you are using a PC Clone, you should not have to worry about anything when you hook up straight thru.

Message-ID: <950910231014\_96190658@mail06.mail.aol.com>  
Rendered body type: text/plain

For Ralph about the Garmin Serial Port...

Thanks for the reply, but I just want to confirm your message saying that if I used a PC clone, I shouldn't have to worry about damaging the GPS-45 if I send the PC's 12vdc output to the GPS-45's input? If that's correct, I'll get right to the task of doing some downloading.

My wife STILL doesn't know I bought the little gadget and even if she finds out, it won't be too detrimental to my health 3-4 months later, but... if I ruin this one, I doubt that I'll get a second chance to pull it off again!!!

Thanks again es 73 de Boyd AR

## 117. MIR heads-up

From: kc5ejk@onramp.net (Robert Winingham)  
Date: Sun, 10 Sep 1995 23:42:54 -0500  
To: aprssig@tapr.org  
Message-ID: <v02130500ac796c5c8a89@[199.1.11.104]>  
Rendered body type: text/plain

German Cosmonaut Thomas Reiter, DF4TR, arrived at the Russian space station MIR. He will stay there for 135 days and operate DP0MIR

The frequencies to be used are 145.800 MHz for downlink, and 145.200 MHz for uplink, as adopted at the IARU session of the AMSAT-UK Colloquium this year.

There should not be any QRM at 145.800 MHz, because this frequency is in the 2-meter satellite sub-band. So listen for DP0MIR at 145.800 MHz, however watch 145.550 MHz too. He will operate not only over Europe, but worldwide.  
-----

"There should not be any QRM at 145.800 MHz"

Hum, only us at 145.790 MIR has +/- 3 KHz doppler,  
so watch your deviation.

We may want to crank the power down for the next few months ?????

Comments ??

This is a question somewhat raised by a friend K9SB

He purchased a Toshiba 3100, and he states it has 2 serial ports, but you can only use one at a time cause there is a switch on the side? He is wondering if he can use this with a GPS and a TNC plugged in. He said he had to dig through the mail and check this out but maybe someone has this unit and can answer his question. He would like to wire the GPS into the computer to do the sending of his position. Otherwise he would need a second TNC and Radio, and ts nice to avoid spending that extra \$\$\$.

Posting in the SIG because a lot of folks have GPS-45's

This came straight from Garmin.  
I am speaking of a regular old serial port on a PC or laptop.  
I use it every day and so do lots of others.

You know, that if you power the 45 externally, the unit runs fine on 5-40 volts. If you REALLY are talking about a GPS-40, then you must check its limitations. The cable for the 40 has a regulator in it. As I understand it though, you are doing DATA ONLY.

Use due care, and it should be no harder than hooking up a TNC!

HOWEVER

If you blow something up, I am not responsible.

And of course, if you really feel uncomfortable- buy their cable. It is now about 40 bucks, I hear. Better than the 140.00 it was this time last year!

RUN APRS IN SPM MODE. THEN WHENEVER HE SWITCHES TO THE GPS, HIS POSIT IS  
UPDATED, WHEN HE SWITCHES TO TNC, HE IS ON THE AIR.

But dont bother. Just build or buy the HSP switch and operate like  
everyone else with one serial port.

> Hum , only us at 145.790 MIR has +- 3 KHZ doppler,  
> so watch your deviation.

I think we need to be VERY mindful of this. 1. Dviation should be cranked  
back down to what's actually good practice for digital work, considering  
switching rate AND AFSK tone frequencies. 2. Power levels are not realsiticly  
gonna change much. 3) If you're using a lot of power, you should be looking  
at an OMNI antenna with a low angle of radiation, so that you're mostly of  
concern near the horizon (all Omni antennas are not created equal!).

I guess I'd expected this for some time. While we pretty well need a  
"homeland" we need to be conscious of the other legitimate users, especially  
those who are constrained by international treaty obligation.

## 125. Sluggish problem

From: wnolle@ro.com (William Nolle)  
Date: Mon, 11 Sep 1995 13:31:54  
To: sprevo@sh1.ro.com, aprssig@tapr.org  
Message-ID: <199509111836.NAA11333@sh1.ro.com>  
Rendered body type: text/plain

Thanks for you reply to my message. I have done a limited amount of checking so far and found that the problem must be at your site. My connects are consistantly 24K (I use the same modem you use). I have a Pentium 90mhz with 8meg of ram. Netscape browser. 32 Bit hard drive.

I would think that the above would leave out the idea that it maybe on my end or telephone problems. I realy believe your system is overloaded and not just during your listed peak hours of 1:00pm to 1:00am. This morning at 8:31am after having a hard time getting connected to a web site i downloaded a couple of files, here are the results of that download.

1685K file High baud rate (2.2k/sec) Low baud rate (1.8k/sec)  
Many, many coplete stops (Some in access of 2 minutes) of complete inactivity on my modem.

-----  
8:50am

3162K file High baud rate (1.6k/sec) Low baud rate (0.7k/sec)  
Again many pauses with no activity at all.

The 0.7 baud rate is unacceptable, i'm sure you will agree?.

I do not call your Tech support anymore since the last time i had problems when i installed Win95 and needed your access number because the one i had entered would give me only 2 beeps and no connect. I asked the person that answered the phone if that was the correct logon number and he said YES causing me lot's of problems trying to figure out what the problems was. I again called back and asked him to make sure it was the correct number and he of course then gave me the correct number. Now i don't want to knock you Tech support crew, i'm sure they are great guys, but they do not seem to dedicated to helping to solve a problem. Another example was when i had problems connecting when i first signed up for you service, i called and asked what Init string i should use to connect to your service since i have the same modem used at your system i thought they would be able to help me. Well i was told to contact US-Robotics, i thought that was rather tacky. Anyway Sir i believe that you ratio of users to modems or ports, (I'm not up on this) is to high, i have done a lot of reading about this and the Max ratio a provider should have is 8 to 1. Like i say you know more about this then any of us do i'm sure. All i know is that when i see a trougput as sloow as 0.4k/sec and know there's something wrong.

APR REPLY: GOTCHA! It got me on a rare long (150 mile round trip to the local (rural) WIDE) too!!!

What has happened is that somewhere a while back, I set the default for NEW USERS to LOG OFF. This is to prevent a new user casually playing and testing APRS from filling up his hard drive with track histories probably withou his knowledge.... The result is that when I do a NEW release that requires everyone to RESTART and RE-CONFIGURE APRS from scratch, that they overlook the need to turn LOG ON. LOG is now saved in the CONFIG file, so once you turn it on, it will stay on.

I hope this explains your lost file. SOrrry. It got me tooo...

Rendered body type: text/plain

You guys know by now that I can't keep quiet about neat ideas... but here is what Ive been working on... ITS NOT FINISHED SO DONT LOOK FOR IT!

APRtrak will be given to tha AMSAT software library for tracking any future satellites that may beacon their POSITS. It will also display the VERY MINIMUM telemetry page if any PICOats eventually fly... Basically it is APRS with most JUNK removed, but ORBITAL TRACKING added! It will not only display the location of all APRS or GPS packets heard, but it will also PREDICT and display the locations of up to 9 satellites.

As you know, the last SAREX mission allowed APRS digipeating, and the upcomming SPRE payload (Dec 95) will also support an APRS digipeater, report its GPS position, and also report its TELEMETRY in a format compatible with APRtrak...

Hopefully by donating APRtrak to AMSAT, I will remove most of my self interest in promoting the use of APRS packets for ground station DXing...

I still think seeing all successful ground stations on the tracking map will be very rewarding to the schools and students...

APRtrak will be out in plenty of time for the Dec mission of SPRE.

Message-ID: <Pine.SUN.3.91.950911195628.21871G-100000@greatlakes>  
Rendered body type: text/plain

Did the decision to choose 145.800 for MIR intentionally straddle a band edge so that thir energy was half in the satellite band, and half out of it?

I am not complaining, but from an AMSAT enthusiasts persepective, if I try to monitor 145.800 for MIR, I have to listen to half-packets on 145.79.

Would not 145.810 have been the correct frequency to choose for a 20 KHz

wide FM signal from MIR to stay within the satellite subband?

Can someone forward this message to the powers-that-be? I'm not complaining, just making an observation that maybe the original thinkers overlooked... de WB4APR (yeah, I know its all my fault anyway, hi hi)

### 131. APRS in WIN background

From: Bob Bruninga <bruninga@nadn.navy.mil>  
Date: Mon, 11 Sep 1995 23:00:17 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950911221539.22715A-1000000@greatlakes>  
Rendered body type: text/plain

I have heard from everyone that APRS does not run in windows in the background... And I have pretty much accepted that as fact...

BUT I was reminded tonight by a call from WB6HAG (Jim) that he has had APRS running in the background under regular old windows 3.1 all along. He is the fellow that suggested I write the STREETS-ON-A-DISK interface so that both APRS (doing the TNC and dispatcher work) could run at the same time as STREETS (which gives street address level detail). APRS periodically writes a POS.GPS file that streets uses to put ALL of the APRS posits on their MAPS. They even support many of the APRS symbols, and other symbol definitions can be generated.

He insists he is not a windows guru, and he has never had any problems running APRS in the background..

Now since Jim had the original idea for APRS to output a file so that STREETS could use it, and he wrote a professional quality manual describing the dual use arrangement (better than APRS docs) I have let him pretty much be the owner of said idea. To WIT, he asks for a \$25 contribution for a copy of the manual.

In over two years, he has sold 1 copy. (And I had pretty much forgotten about him until he called tonight with a minor bug with runing both STREETS and APRS under the faster WIN95.

THE POINT IS. HE SAYS APRS RUNS FINE IN THE BACKGROUND UNDER WINDOWS 3.1 and WIN95, always has, and he has never had any problems in 2 years... AND we are talking about REGULAR OLD APRS. The "STREETS interface in APRS" is built into every copy of APRS, and all it does when activated is to periodically WRITE a position file in the format desired by STREETS.

(Not one APRS-STREETS-interface V# sold yet...) See COMMERCL.txt.

So what are we all missing? I dont do windows, yet, so I cant help...  
And he is the only one that says IT DOES WORK. hi hi

If anyone wants to buy his manual and prove us right or wrong, ill happily issue him the APRS-STREETS-INTERFACE V#.... By the way, Jim deserves the contribution, since he updates his manual frequently but still has only sold 1 copy... He also submitted an article (significantly chopped to pieces) that just appeared under the column "UPGRADE... DONT STOP NOW" (Title NOT related to APRS) in Radio FUN magazine... August, page 21.

Other background about STREETS: It costs about \$200 and each county costs \$95 It is a commercial product sold by Klynas Engineering. See my COMMERCL.txt file...

BUT AGAIN, THE PURPOSE OF THIS MESSAGE IS NOT TO SELL STREETS OR THE APRS-to-STREETS V#s, but to remind us all that WB6HAG says that ALL VERSIONS OF APRS run fine for him in the BACKGROUND on Windows 3.1, 3.2 and WIN95... Jim Carter WB6HAG said he just got on internet this week and will subscribe to APRSSIG in the next day or so... In the mean time, he can be reached at 2029 W. Hall St, Santa Ana, CA 92704.

Yes, I have a copy of his manual, but I dont do windoz, and its all greek to me....

---

## 132. APRS IN Windows

From: jeff.brenton@espi.com  
Date: Tue, 12 Sep 95 02:00:57 -0500  
To: aprssig@tapr.org  
Message-ID: <9509120200.02TYL0T@espi.com>  
Rendered body type: text/plain

Bob, APRS works fine in the background under Windows and OS/2, if you are willing to accept certain restrictions.

If you will accept 16 or 64 color modes, APRS can run in the background. If no task makes use of the high-resolution VGA (256 color), APRS will run when in the background.

However, most multimedia products insist upon 256 or even 32,767 color modes be enabled. Under OS/2, since the Presentation Manager (aka the "desktop") is always running, and is set to the high resolution, APRS stops when in background, unless you limit it to CGA graphics (looks ugly!).

In Windows 256 color mode, if you run two DOS tasks (APRS being one of them), APRS will run when the second DOS task is running full screen in the foreground, but it will stop if you try to run it in a window, with Program Manager or some other GUI program running.

This has been my experience - the last item (APRS running in background with another DOS task in the foreground) actually surprised me; I hadn't tried just switching between the DOS tasks during the first test.

Eventually, I'll have a 286 machine sitting here to run APRS, so I don't have to worry about backgrounding it in OS/2...

Bob Bruninga sez:

>

>

> Did the decision to choose 145.800 for MIR intentionally straddle  
> a band edge so that thir energy was half in the satellite band, and half  
> out of it?

I believe the decision was arrived at to diminish the effects of an FM signal on the resident satellites and those planned that might use the 2 meter band. There's nothing in the rules (or treaties) that says they have to be well within the band... just that by being inside the band they'd be somewhat protected by treaty.

> I am not complaining, but from an AMSAT enthusiasts perspective, if I try  
> to monitor 145.800 for MIR, I have to listen to half-packets on 145.79.

I've already spoken on that.

> Would not 145.810 have been the correct frequency to choose for a 20 KHz  
> wide FM signal from MIR to stay within the satellite subband?

I might have been better, but there's hardware using .810 +/- a little.

> Can someone forward this message to the powers-that-be? I'm not  
> complaining, just making an observation that maybe the original thinkers  
> overlooked... de WB4APR (yeah, I know its all my fault anyway, hi hi)

I suspect that the SAFEX powers that be have reached their decision, and it's  
just done. They were not inclined, in my previous experience with them, to  
make a decision more than once.

## 134. EUROMIR FREQUENCIES

From: wd4hoy@gremlin.greenville.lib.sc.us (John Mckay)  
Date: 12 Sep 1995 00:10:22 EDT  
To: AMSAT-BB@amsat.org  
Message-ID: <81087902933039@gremlin.greenville.lib.sc.us>  
Rendered body type: text/plain

There seems to be some concern over the downlink of 145.800 during  
EUROMIR's Mission and rightfully so since 145.800 would place  
half the signal out of the normal bandpass for this type of operation  
not to mention the packet interference from 145.790. The following  
was downloaded last week off of Compuserve and may shed some light.

SAFEX I Frequencies (EUROMIR'95 Mission)

## 135. Re: [APRSSIG:3267] APRS in WIN background

From: paul@paccomm.com  
Date: Tue, 12 Sep 95 08:41:09 UTC  
To: aprssig@tapr.org  
Message-ID: <5480@paccomm.com>  
Rendered body type: text/plain

We have some guys here this week writing some other code.  
They use VisualBASIC in a Windows environment and really know what  
they're doing.  
Couple of points. I've seen code fragments. This is one neat language!  
Get a Visual BASIC compiler Bob!  
It runs FAST - almost as fast as C++, but a port from QBASIC would  
be tricky but very do-able.  
Finally, they've been playing with Windows95 right through everything  
and say so far that for developing that it STINKS. Many, many  
machine crashes, etc.  
Maybe the hurdle to Windows (old Windows) is not too bad...give it  
a thought.....

Thanks to the two of you who (Thanks Bill and Bill!) responded to my request for
GPS/TNC configuration info. I'd still like to hear from others who have
successfully integrated GPS with a TNC, either stand alone or with an APRS
computer.

TNC Make and Model:
TNC Firmware Rev:

GPS Receiver Make and Model:
GPS Receiver Firmware Rev:

Interface Converter/Switch Make and Model:
Cable Pinout (sample below)

TNC	GPS

Garmin data/power cable wired to DB-25 for TNC, DB-9 for computer and to a coaxial power jack.

>
>Comments:

With parallel DB connector GPS can talk to both computer & TNC. Computer can also upload GPS using Gardown7 software. Computer cannot talk to TNC but could if I added a switch to reverse data in & out (pins 2 & 3) to computer.

TNC and GPS are both powered together. KPC-9612 internal jumpers set to connect DB-25 pin 25 to internal power. 12 VDC can be connected either via TNC coaxial power jack or jack attached to Garmin power/data cable. GPS can also be powered without any other connection via jack attached to cable, I use a cigarette lighter plug in the car.

I also use the Radio Shack scanner antenna coaxial cable (with suction cups) to place the GPS-45 antenna on the car roof.

If you want more detail on the connector pins, I can open the connector shells and record them.

I'll second the VisualBASIC discussion. I'm developing a lot of software in it and it's not too bad.

I will *NOT* be developing any Windoze 96 code for at least one mre release. >From where I sit, it's still not mature and it's still crashing... Iv ebeen listening to a couple of the "knowledgable" Win97 guys on the linked repeater system I run with talk about how easy it was to install. And reinstall. And do again. Nope. Not yet. I have too much going on to lose time and/or functionality.

As to porting the code: I suspect it'd take about 20 hours to port the APRS stuff based on some experiments I've done with DEFRAG and MAPFIX. They're not ready for prime time as windoze apps, and a long way down the priority list for me, but I've started. I'm looking for larger models so we can get past the silly DOS-induced limits for map sizes.

I also suspect there are faster ways to redraw maps than what we're doing.

73, gerry

141. Hints on 145.800 & .79

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 12 Sep 1995 16:24:33 -0400 (EDT)
To: aprssig@tapr.org
Cc: amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.950912150515.4786C-100000@greatlakes>
Rendered body type: text/plain

On Tue, 12 Sep 1995, someone responded to my suggestion:

> >Would not 145.810 have been the correct frequency to choose for a 20 KHz
> >wide FM signal from MIR to stay within the satellite subband?
> >
> No. The telemetry beacon on AO-13 is 145.812.

COMMENT:

But AO-13 is visible for 8 hours a day continuous. A MIR downlink on 145.810 only has interference potential with AO-13 for about 7 minutes only 6 times a day (8%) at one ground station. Plus there are other mitigating considerations:

1) MIR IS NOT A FULL PERIOD 100% SIGNAL. A duty cycle of .00005% has been observed at this station. Even under QSO conditions, a duty cycle of 20% or less is probably the maximum. Throw in sleep times and work times, and a duty cycle for a COSMONAUT DXer could rarely peak above about 5%.

2) MIR will only interfere in its FOOTPRINT, which is probably 5% of the footprint of AO-13. Yes each ground station will see the interference, but NOT at the same time worldwide. No AO-13 critical data should be lost. Also AO-13 BEACON telemetry is NOT 100% either...

So it appears to me that accepting an overall 5% x 8% or less than 0.5% potential for loss of AO-13 telemetry at any ONE ground station is a minimum price to pay for spectrum efficiency.

RECOMMENDATION:

In the meantime, stations that are listening for MIR on 145.800 might consider setting their radios to 145.805 initially to minimize downside packet interference, while still being able to hear MIR APPROACHING perfectly clear due to the +3 KHz of up doppler while MIR is incoming.

Yes, Yes, Yes, By all means go to Visual Basic Bob! We windows users need a full-featured windows APRS version. Windows help screens, pull-down menus, status areas off of the map, and, most importantly, a full resolution map capability up through 800X600-256 colors Super VGA. Also full mouse control of all functions. You can use Visual C++ in selected modules if you need to speed up certain functions. Ham radio has been too slow to go to graphical interfaces but now some satellite tracking programs are being written for windows and are a great improvement. DOS is very limited and clunky and is only useful for outdated computers.

The ability to run in the background is very important even for those who can afford a separate Ham computer. Many people run different applications on several bands at the same time or use helper applications but can not do so with APRS.

MIR, like other LEO satellites will usually make no more than 6 usable passes over any one location per day for a duration (horizon to horizon) of about 10-12 minutes each. OSCAR 13, on the other hand (beacon on 145.812) is usable up to 14 hours at a time depending on how the orbit relates to your location. It would be a shame to deny someone a chance to work MIR, but the odds are that unless someone starts an APRS program within an hour of MIR passing over, (and we kept keyboard chatting to a minimum) that the most that the "MIR hunters" are going to hear would be one or two brief ID or POSIT packets, unless they were near a high profile wide digi site.

I will be willing to send via private email a schedule of the times that MIR should be over your location if you tell me (privately) a bigger city near you.

My recommendation for a GPS:

The Garmin 45: Nice features, good price (\$300). Can attach ext. mag mount antenna and easy to use (non-std) data cable. Use to have the Garmin 50 when it became affordable, and the 45 is leaps and bounds more capable. Beware - this is a marine GPS, not an aviation unit. Max speed is 99mph for the marine

units. Works just fine w/APRS.

Aloha, Dave

> > Please not 145.810, for A0-13's beacon is on 145.812
>

Having some connection with this, I can advise that the *effective* A0-13

beacon frequency is at present 145.8085 MHz on my radio set to USB.

How's that? Well, with the current spacecraft attitude, northern hemisphere stations can only seriously obtain telemetry just after perigee. At this time AO-13 is receding at some 7 km/s, so the doppler shift is quite high.

However it's not going to give a command problem since we can, and as often as not do, switch to the higher powered beacon on 145.985 MHz for telemetry collection and command.

If there is any grumble at all about this, it will come from outside the satellite fraternity; the usual vocal minority who are sore about losing 145.800 MHz (and 145.825 MHz) as repeater output frequencies!

> How many hours per day is this going to be a problem, anyway?

In reality, world-wide, there are intruders in the 2M satellite segment who cause more interference than the proposed operation ever will.

73 - James AO-13 Command Station.

Is it an AEA TNC? AEAs seem to have a mode that allows the PBBS and KEYBOARD streams to intermingle. This has caused problems for several new packet users around here lately.

Hi all,

The selection of the pair 145.200 MHz for uplink and 145.800 MHz for downlink is based upon an old repeater plan for Region 1.
The pair have been used for repeaters - but not any more. Therefor the frequencies should be available (at least in Europe).
This has been discussed a number of times both at the AMSAT-UK Colloquium at the University of Surrey - and in the Region 1 VHF comity. In the end it has been recommended by the Region 1 VHF comity.

The problem with 145.550 MHz at least in Europe have been of such proportions that communications with MIR very often have been impossible.

Hope that the frequency pair can be used without too much inconvenience also in other parts of the World.

Have to agree with John, I run a 386 notebook in the mobile, and working a mouse can't be any more difficult than typing on the keyboard, with my head stuck under the dash, on the Washington DC beltway at 55 Mph. By the way I have to fix that -- but that is the essence of progress. The most often heard comment in scientific discovery is not Eureka! but "Hmmm, that's interesting.

Sometime ago I started a version of WinAPRS in Visual Basic. It supports lots of cool things, like multiple radios, multiple TNCs, GPS, Compass, Doppler, Zoomable maps, user definable icons, lotsa stuff. Ralph Fowler, N4NEQ, has been (tightfully) hounding me to start beta testing it.

I haven't been interested in working on it lately, but if there is enough interest, I would consider releasing the code into public domain. The only problem is that it uses 2 VBXs from Microhelp, and I can't distribute the development version of them. If some enterprising individual were interested in writing a functional equivalent, that would be great.

It currently works well enough to track objects, but it doesn't expire them after there has been no activity. There is no support for WX operations, as I have no interest in them.

It also supports another protocol besides APRS, which had been intended for a commercial release. I suppose this should be axed out.

It also was intended to support a modem connection, and a TCP/IP connection, via WinSock.

The internal structure is based on message passing queues, which almost all seem to work. I was streamlining it last time I worked on it.

If y'all have any interest in something like this, let me know. I can also post some more details about what it is/was supposed to do.

Hi all,

The selection of the pair 145.200 MHz for uplink and 145.800 MHz for downlink is based upon an old repeater plan for Region 1.

The pair have been used for repeaters - but not any more. Therefore the frequencies

should be available (at least in Europe).

This has been discussed a number of times both at the AMSAT-UK Colloquium at the University of Surrey - and in the Region 1 VHF comity. In the end it has been recommended by the Region 1 VHF comity.

The problem with 145.550 MHz at least in Europe have been of such proportions that communications with MIR very often have been impossible.

Hope that the frequency pair can be used without too much inconvenience also in other parts of the World.

73 de OZ1MY of AMSAT-OZ
oz1my@amsat.org

Maybe if we all can coexist on this plan, Mir will soon carry GPS and we can start tracking it.

John C. Wren--

I'd like to see you keep working on this, but if other interests have sidelined it- please pick the best qualified person and turn it over to them.

If any one wonders what this thing looks like, ask Paul or Gwyn at PacComm- both had an in-person demo last Month in Tampa.

I agree that using the old laptops (I have 1 8088 laptop and 4 286 laptops) is economical, but Bob has stressed the limits of Qbasic. It is a remarkable program, and we should support him in enhancing it for more modern platforms!

Keith (McAPRS) Sproul has a nice program, too. We PC users have an equally good platform available and should utilize it.

I'd like to see the basic formats of things remain the same, so users (like myself, sometimes) with 15 year old technology can at least do the rudimentary things. But I'd buy a new laptop if I could run APRS in a window (with better than VGA resolution drivers loaded) along with other programs I like.

GO BOB (or John, or whoever) GO!!

As much as I dislike Windoze, in its many forms and faces, VB offers the ability to clean up the code somewhat. Actually, the right answer would be to recast the code in C and go on. There are plenty of good C's for DOS (OK I'll admit it... that's a contradiction...) but the transformation from DOS to Windoze is one a lot of folks are making and the level of pain induced in going to VB is less than that of going to C.

And, while we're at it, I've one of the Grid laptops, too. And I'll have to keep running an old compile if he does step up. But that's not a hit, since it already does most of what I want/need already.

I would also be glad to help with this effort. I have done a fair amount of programming in Visual Basic and in Visual C++. One minor question, has anyone checked with Bob about the licensing for this version? He does reserve the right to decode and display APRS packets from any computer program. I'm not sure what his position is on creating new versions of APRS for Windows. I understand that transmitting them does not require a license? So you can send them from "dumb" devices that are stationary?

Visual C++ would have several advantages over VB for this type of project. I would like to see a multiple document interface version, so you could have several maps open at different zoom levels at the same time. I attempted to write a map editor for Windows a while back in C++. The main problem that I had was manipulating the DOS maps at high resolutions (1024x768 or better). They lost their shape in some instances. Maybe if the Macintosh version uses more detailed maps, they would be better for the Windows version. In any event, Windows can handle much larger maps with more colors than the DOS version. This could lead to better maps, or we could try to hold them the same for compatibility.

Message-ID: <950914142006.21a07a77@exame2.dseg.ti.com>
Rendered body type: text/plain

Comments re possible rewrite of APRS

1. I'd like to see an upgrade of APRS to run in a more modern environment. However, before we settle on WINDOWS (or WINDOZE or whatever), some observations:
2. One of these days - probably sooner than we expect, we will all be running machines with decent operating systems. Of course, the set of decent operating systems for the PC world is pretty limited. It emphatically does not include DOS, WINDOWS, WINDOWS FOR WORKGROUPS, or WINDOWS 95. It does include Windows NT, and probably (not sure of this) OS/2. If a complete rewrite of APRS is to be done, it should be done understanding the requirements of a decent operating system.
3. Decent operating systems, of course, protect themselves and their users from malicious and/or misbehaving applications. This means that the operating system alone must handle all interrupt processing, all physical I/O operations, and must check that all user requests must be for things that are legitimate. Just imagine - a computer system with NO viruses - and no possibility of viruses!
4. So - any rewrite of APRS should understand that all I/O and interrupt operations will be handled by operating system calls, not directly!
5. The only DOS application I am still running is APRS. I'd love to run it under Windows NT, but Windows NT refuses to let it do the I/O operations itself - consequently APRS will not run at all, foreground or background, under Windows NT.
6. Would like also to put in a plug for PASCAL as the language of choice for a rewrite. C works, of course, but is very difficult to read and understand, even for those who wrote the code originally, after a few weeks or months.
7. In closing: APRS is a WONDERFUL system. I am much impressed by it and by all the work that Bob (and Keith) have put in to get it to its present capability. New and innovative things like APRS are what keeps Amateur Radio fun. Keep up the good work. I'll be glad to pitch in and help where I can - maybe some special coding in PASCAL?

Some people apparently thought that I was advocating that DOS APRS be dropped in favor of a Windows version. This is not what I was suggesting. Many programs have both a DOS and Windows version and Visual Basic can be used to write for both operating systems. The DOS version is severely limited by the DOS memory limitation but this can be mitigated by the use of disk based overlays for some of the independent functions such as the DX cluster mode. I have used this technique for CP/M and C-64 programs and it works very well. The Windows based version can open up additional functionality due to the extra memory available and provide greater ease of operation through the GUI interface. The availability of high resolution maps that can be zoomed is alone worth the price of admission, ie. reprogramming in Visual Basic. The DOS only platform is dead but like CP/M and the C-64 it will take a little time for it to realize that fact.

Unfortunately if Wren releases his code to the public domain, then my continuing support of APRS is dead. Its a simple fact of life. We all have 24 hours in a day that we must equitably share among work, sleep, hobby and family.

My wife has tolerated my APRS efforts only because the contributions that dribble in are deposited directly in my kids college fund. When that stops, so does my play with APRS. Without the excuse of their college fund, I could no longer justify robbing my kids of their father... hi hi

I have encouraged Wren to retain ownership of his code and sell it at fair market value as a licensee of APRS. Income would encourage his continued efforts. Its a fact of life.

Free toys soon fall to neglect. Take a look in the bottom of your kids toy chest.... Or your old disks....

APR REPLY: Obviously my slow foot dragging on working on a Windoz version of APRS was because I knew that Wren was working on the program and the last time we had spoken, I thought we had an informal understanding of how to release it under a licensing agreement. I decided to concentrate on the DOS version and see what he produced. His recent message caught me a little off-guard...

I am sitting here with the 9 disk set of Visual Basic all ready to go, just wanted to finish APRtrak first....

I DO WANT A WINDOZ VERSION... hi hi

That's why I breezed past the article. Didn't see any real benefit. we can
already remote our passive antennas. Now if the patch has a preamp.....

MA/Com has a nice 20+ dB gps preamp chip for 8 bucks.

1. OS/2 is a real operating system. It's also what Windoze 99 purports to be, minus most of the bugs. It's not *nix, but it does handle most everything I've run across appropriately.

beyond that, I wish to second the commentary re: DOS, etc. NT is acceptable, but we'll have to get past NT 3.1 before I'm really convinced.

> 4. So - any rewrite of APRS should understand that all I/O and interrupt
 > operations will be handled by operating system calls, not directly!

The OS/2 programming environment will handle this, and will allow interoperable compiles for other "applications" as well ie., windont interoperability).

Runs fine at my office on NT 3.1. My main problems with NT center around the number of GPFs I've been getting with some of the s/w I have to use, although I suspect Trimble Navigation of poor programming hygiene.

Not in my worst dreams! C can be readable if you adhere to some straightforward documentation requirements and descriptors. The same sort of thing I enforce on myself for the VB code I'm now writing. It's not difficult, and it's not unreadable, although there is a learning curve.

Let's not resurrect a language that was designed for teaching and misused for production, simply because Borland put a compiler in the hands of the masses.

Unfortunately, it appears that Micro\$oft has decided to can VB 1.0 for DOS because EVERYONE knows EVERYONE is going to Windoze... And VB 3.0 for Windoze is not capable, in my limited perusals, of producing an executable for DOS... If I'm missing something, please let me know! I've a couple of apps that could do much better without the Windoze interface for stand-alone boxes.

How about a Unix-based OS?

186. Last Meteor Query

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 15 Sep 1995 00:53:16 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950915002732.4450B-100000@greatlakes>
Rendered body type: text/plain

In reading Stan's column announcing our meteor scatter test, and suggesting the results will be in the next QST, I realized that my REPORT is missing one vital bit of data. My report as previously posted here shows everyone that heard or were heard. (19 and 18 I believe). To gain a complete understanding of the "success" rate, I need the following additional info:

DID you have at least 100 Watts transmitter power * AND *
USED at least a 10 dB gain BEAM antenna * AND *
MADE a CONCERTED effort... * AND *
WERE in a relatively QUIET area with MINIMUM QRM * AND *
STILL did NOT copy any DX meteor packets??

If so, lemme know, but only if you meet all of the above criteria, since they are being used as sort of a benchmark for establishing a minimum meteor scatter station.

The biggest lesson learned for the next event, is that everyone that is NOT a BIG GUN, should listen only, so that more stations CAN hear the packets when they DO get reflected...

BY THE WAY. I am NOT SHOUTING, when I capatilize, hi hi, I am just highlighting key words for those of you who may just scan messages briefly before hitting the DELETE key...

Just to throw a couple more copper coins into the kettle...

There is at least one software supplier advertising map-drawing components for Borland's latest, Delphi. The advertisements look good, but you know how ads are!

Delphi allows you to do things like define an object, let's call it "AprsObj", which has many properties, such as "label", "latitude", "longitude", "direction", "velocity", "symbol", an array called "heard", and "ExpireTime", amongst others.

You can create new AprsObj instances as new objects are received, and tell existing ones to update their parameters. The objects would have code (methods in Delphi-speak) to plot themselves on the map, along with any velocity vectors. You could select one with the mouse, and it would display extra information about itself, such as temperature, humidity, rainfall, etc., if it's a weather station.

The possibilities are endless. Wish I had the time to do it!

More important than choosing which language to use, which platform, which system, which coffee maker (an espresso machine for me, please)... It seems to me that some sort of STANDARD for maps as to be define. We already have different maps (not compatible) for mac and dos. We should come out with an unique way of coding maps which make them usable on any platform at any resolution. MacOS, Windows, XWin, are supposed to be device independant for graphics, so should be the maps.

Bernard, KB2TGH.

I have been watching the rewrite issue and have even contributed to it, but I see a problem here.

The largest one is that Bob and Keith are going to get so annoyed with us, that the project will end.

Both of these gentlemen have contributed a very large amount of time and money to develop a product that a very large number of people have received a large amount of enjoyment from.

Having been on the other end, I ask that you tread lightly about asking for a rewrite of either system. The pressure that both Bob and Keith receive is unbelievable, so I ask that all members please be careful and enjoy help Bob put his kids through school.

Thanks for listening!

Your right, but i think most would be willing to pay a bigger price for such software. I know i for one wouldn't think twice about having a version that i could run under Windows or whatever that would have the capability to have more detailed maps and features that would allow the use of a mouse. It's a simple fact of life either you are willing to pay those fellows to all this work and make it worth while the effort, or don't bother trying to get it done. The thing you have to ask yourself (Would i do this). I can't so i look to others to do the programming and i'm willing to pay them for doing it (Gladly). In other words guys the support has to be more then just talk. Just my 2 cents worth!.

Bill KE4EER

Date: Fri, 15 Sep 1995 16:33:38 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950915162538.20996A-100000@greatlakes>
Rendered body type: text/plain

Well, I decided its time to get some radios and called MFJ. Mr PAN agreed that they would sell radios TUNED AND TESTED on 145.79 for only \$14.95 additional. I think the list price for the MFJ-8621 5 watt two meter radio is \$119.95.

He said they are getting production up to speed but that the reason they are not advertising the radio, is that they aren't up to full production yet, and they anticipate a great demand...

I then ordered 5 through my local dealer, and got a commitment of next week!

It will be interesting to see if they are on schedule....

Oh, yes, they were well aware of the individual on this SIG that could not get the radio to tune to 145.79, and said it was because that first batch of xtals for 145.79 did not meet their spec. Is fixed now.... Hope it wasn't too painful for him... Ill let you know how I make out, and maybe I will finally be permanently on the air mobile on 79!

The Windows version of APRS has been born. Tonight I met with Keith
Sproul the author of MacAPRS and we have made a tentative licensing
agreement so that he can re-compile his C code into a fully supportable
WINDOWS version of APRS. Not only does this take advantage of all the
code that he has developed, but it also assures interoperability, since
we have been working together since I presented the first APRS paper at
the ARRL computer conference several years ago...

Give him some breathing room and the result will be worth it. He is right
now driving back to new Jersey, so I thought I would give you a heads
up. Expect a formal announcement from him in the next few days...

This relieves the pressure on me, so I can continue to support and refine
the DOS versions for those of us too old and tired to upgrade... hi hi

203. [APRSSIDIG:3333] MFJ DATA R

From: jeff.brenton@espi.com

Message-ID: <9509160019.00G4A07@espi.com>
Rendered body type: text/plain

It is interesting that MFJ said their first batch of crystals wasn't "tuned to their spec"... they told me that, when they checked various crystal sets, all the 145.790 sets were fine, but he found _one_ set, for a different frequency, that didn't meet spec...

As for the level of pain, I'm still not on the air on 145.790, because I haven't had time to run the tests to see just where the current crystal set tunes. Transmit is OK, but you need both to be a courteous station! B-)

Message-ID: <013.01361221.SLSC65A@prodigy.com>
Rendered body type: text/plain

I have been reading with interest over the issue of re-writing the APRS program so it would run in WINDOWS, either 3.1 or "95" and especially "in the background", why would you want it running in the background, you can't see what is happening?

Bob has made it known that he knows nothing about writing software for Windows operation, he is fantastic when it comes to DOS..APRS was not his first venture that was used world-wide.

Why not just go out and visit a few of your friends and see if you can pick up an old 286 and upgrade it to VGA and run Bob's DOS version on that, the monitor can always be turned on and you will be on the front lines of all the action.

Who else do you know that will come out with a new version every week with some new feature added, shucks, I run the MSYS BBS program here and I am lucky if I see a new version every 6 months.. Soon as something hits Bob's brain, it is in APRS and is distributed so everyone else can play..

If you think you would write a better APRS program in something that will run in Windows, then please dream up another type of program, something new and fresh and make it so that everyone runs to your door for a copy of it like Bill Gates did with Windows95! Let Bob and Keith have APRS!

Well, I have said my piece...73 all, de Rod

Hey Bob,

Been sick for awhile and haven't done much with APRS here in Washington State. Hopefully I can do better in the near future. As to making APRS work under windows, I am not a great Windows fan but for what we are trying to do in Search & Rescue it is just about the only game in town. Would very much like to see a windows version and helping on beta testing if needed. Was wondering if you discussed whether people wanting to upgrade would have to pay full price or an Upgrade price reduction??? Not that I am cheap but I am on a very limited budget.

Thanks for all the great work.

So that it doesn't lose updates when it's in the background, and you have all the data. For one particular application (research) I have it'd be nice to not require the whole machine just to get data via telemetry on which side of the bush the cows are eating, but that's what I've had to plan for. If my grad student could do other "useful" work, it'd help keep him interested over the week at a time he'll be stuck in the middle of nowhere.

Dave/WH6YC. A fellow amateur interested in APRS has access to either the Magellan 2000 or Magellan Trailblazer for a reasonable price, but in my initial discussions with him it doesn't look like either are APRS compatible. The Magellan 2000 has no data output, and the info he's getting on the Trailblazer doesn't appear to be routine NMEA (GGA, RMC, VTG, etc).

Is anybody using the Trailblazer w/APRS that can clarify this? I'm recommending he switch over to a Garmin, like the 40 or 45, or 90 for aircraft use (he flies too).

Comments? Thanks and Aloha.

210. COMPAQ & Credit Card Fraud

Aloha de Dave/WH6YC.

Interesting event occurred last week. With a new credit card (not used before) I placed a telephone order with Compaq Direct Plus in HOUSTON. Products arrived OK, but several days later my CREDIT CARD company called to inquire if I had just purchased \$15.00 gas from an Exxon in HOUSTON. Of course not, I'm basking in the sun in Hawaii !! They said an unknown person, with a credit card, charged the gas. Since it wasn't me, the credit card co. canx the card and is sending me a new one. They also said I will not be liable for the first \$50, or any other charges that may appear or attempted.

While this has nada to do with APRS, you are my closest friends and I wanted to get the word out - watch for credit card fraud. It's alive and well (at least in HOUSTON).

OK, gotta go bask in the sun some more. Trip to San Diego on Monday and I want to be nice and tanned. Aloha, Dave, HI APRS Coordinator.

MacAPRS for Windows

Automatic Packet Reporting System
for Windows

September 16, 1995
NORTH BRUNSWICK, NJ: Mark Sproul (KB2ICI) and Keith Sproul (WU2Z)
authors of MacAPRS, the Macintosh version of Bob Bruninga's (WB4APR)
popular packet radio mapping system announced today that they will be
porting their Macintosh version to Windows. This will be the
official version and has the backing of Mr. Bruninga. The current
plans are for beta release by Christmas 1995 and for the final

release to be at the Dayton Hamvention in May of 1996.

APRS is a multi-faceted system used primarily within Amateur Radio for tracking many different types of things. APRS is used for tracking Weather, for tracking moving cars, boats, weather balloons, and many other things. It can also be used as Graphics Information System for many different aspects of Amateur Radio.

The original version of APRS was developed by Bob Bruninga, WB4APR, to run under DOS and was introduced at the 1992 ARRL Computer Networking Conferences. MacAPRS was released at the Dayton Hamvention in 1994.

The Macintosh version is written entirely in C and will port easily to Windows. Keith and Bob have worked hard at keeping the two versions compatible and by using all of the C code already developed for the Macintosh version, it will ensure complete compatibility on the Windows version. In addition, the two versions will use the exact same map file format so all of the wonderful maps that the Mac users have will be immediately usable by the Windows version.

When asked about future plans, Mark said, "When we finish with the Windows version, we planning on doing an X-Windows version as well."

To keep up to date on the status of MacAPRS for Windows, watch the Web Page (<http://www-ns.rutgers.edu/~ksproul/APRS/index.html>)

The current versions MacAPRS (for Macintosh) and PC APRS are available on:

<ftp://ftp.tapr.org/tapr/SIG/aprssidg/upload>

Glad to see it, thanks guys, including especially Bob!
I had hoped that the version being developed here would formulate into something...
it worked pretty well, but when an author (and I mean of the failed earlier Windows attempt --
NOT Bob Bruninga) cancels a project- I'm glad the project can be completed by someone else.
I think porting the C code over is a great idea. Wonder why it wasn't thought of before?
Could it have been a little "Mac Myopia? :)) <big big grin and wink with tounge in cheek>

Anyway, good luck.

218. APRS in background

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 17 Sep 1995 01:25:02 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950917011133.24787F-100000@greatlakes>
Rendered body type: text/plain

Now that the pressure is relieved for Windoz, and while sweeping the
driveway, I was pondering a way to bandaid APRS to help it run in the
background better. Someone said that the main problem was that APRS
wanted to write to the graphics screen in 16 color mode but that the
rest of the WINDOWS applications wanted to be in higher modes. or
something like that.. Here is the thought:

If I let the F10 key be a "DOZE" toggle that told APRS to clear the screen and to stop updating posits to the map, and writing to the bottom line, then it would run there with a black screen, but still do everything. Then when you told WINDOZ to place it in the background, would it go there more amicably? If so, I could make this change trivially in the next version to see if it helped.

When you brought it to foreground again, just hit space bar to update the map with everything that had been added to the "lists" while you were away...

Additional on my MFJ 8621 experience...

Finally got some time to do some tuning the old fashioned way, by ear. The instructions provided by MFJ did not work for the receive crystal supplied, so I got out a speaker and my HT, and tuned for maximum quieting and clarity on a touch tone, broadcast on 145.790. The radio now functions, although I have not been able to check its sensitivity. It did, however, copy packets off the air after tuning.

When you start APRS it asks you if you have a TAPR, KAM or AEA TNC. If you

hvae paid you fee to Bob's kids fund you can then save that config so it (APRS) does not ask you each and every time.

223. MacAPRS version 2.0

From: Keith Sproul <ksproul@hardees.rutgers.edu>
Date: Sun, 17 Sep 95 16:29:52 EDT
To: aprssig@tapr.org
Message-ID: <CMM-RU.1.4.811369792.ksproul@hardees.rutgers.edu>
Rendered body type: text/plain

MacAPRS 2.0 is now up on ftp.tapr.org

This version has been long in comings, and has a lot of new things in it. The last release of MacAPRS was on June 29th. Nobody can accuse me of too many releases, hi hi...

New features in MacAPRS 2.0

- * Enhanced Call-Book CD-ROM support
The following CDs are now supported
 - * Buckmaster Old version, US Only (ALL Buckmaster CDs)
 - * Buckmaster World pre-1995
 - * Buckmaster World, current. This is THE BEST!! and MOST data
 - * Percon
 - * Amsoft
 - * QRZ
 - * FCC Data from Internet

In a couple cases, you have to make an Index file, but the ability to do that is right in the program.
- * With all of these data bases, you can open a CALLBOOK LIST window that shows ALL of the call signs in the data base. This list is searchable by call-sign (only at this time) and you can scroll through it, then option-double-click and it will show you where that person lives (see below on option-double-click)
- * If you have one of the above data bases, you can create another Index file that enables the following:

You can click-drag a region, say for example, 20 miles radius from your home, it will search through the entire data base and give you a list of ALL the hams that live in that area. Then you can SAVE that list to a tab-delimited file that is importable into any database program such as FileMaker.!!

THIS IS WAY COOL! And it takes less than 10 seconds on a 25hmz 68040. and about a second!!! on a PPC

You can create as many different SELECTED CALL SIGN LISTS as you want and have them all open at the same time.
- * In either list, the FULL callbook list, or the SELECTED STATION LIST, it displays call-signs with expired licenses in RED and callsigns whose birthday is that day in BLUE..
- * You can SAVE from any of the station lists, i.e. ONLY the weather stations, or all stations, or all flagged stations etc. This SAVE creates a list of POSITION REPORTS that is reloadable back into the program.
- * From ALL LISTS, (Station lists, Airport List, DX List, etc etc) You can OPTION-DOUBLE-CLICK, or OPTION-RETURN and it will search through all currently open maps, find the BEST (highest magnification) map that that item (station, airport, DX country, etc) can be shown on and it switches TO that map, and shows you where it its.

In the case of the CALL BOOK list, it will then SPEAK the call and name to you (If you have the speech manager loaded)

- * If you have the Speech Manager, you can select between NORMAL letters for call signs, i.e. Double-you You Two Zee, or you select Phonetic calls, i.e. Whiskey Uniform Two ZuuLuu
 - * When you quit out of the program, it automatically saves the Packet Statistics and the Weather data (if you have a WX station). When you start the program back up, it will re-load these data files, that way you don't loose the fancy graphs when you quit and re-start.
 - * It now supports the Heathkit-5001 weather station, However, this has NOT been tested with a real unit. If you have a Peet Bros Weather Station, make sure you go to the Weather Settings and select it, where-as before, you did not have to do this.
 - * It supports Wind Gust from the Peet U-II and from the Heathkit. This info is transmitted in the weather info and displayed in the Weather Station List.
 - * In the past, Option-Double-Click on a location in a map-window takes you to the NEXT smaller map that contains that point. Shift-Option-Double-Click takes you back UP to the next BIGGER map.
- In addition to all of that:
Control-Option-Double-Click takes you to the SMALLEST map that contains the point that you double-clicked on. This is good for going from the Entire-US map to your local state map in one shot, instead of having to do it in a few steps, or having to go to the map menu and selecting the map by name.

!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

Now before you to excited on the next item, realize that:

A: This is why it is a major jump from 1.5.5 to 2.0

B: This is working, but in its EARLY stages, and has a ways to go!

MacAPRS now supports BIT-MAP maps, i.e.

- * a scanned in nautical chart
- * a screen-dump from Delorme
- * a fancy map TIFF file from the USGS
- * Any map you want to scan in on your scanner.

In the near future, I will put up some test-maps on ftp.tapr.org that have the correct EXTRA data that makes this work.

MacAPRS needs a special RESOURCE attached to a normal PICT file to make all of this magic work.

Steve Dimse (K04HD) from Florida is working on a simple utility to add the coordinates to the files. In the near future, MacAPRS will have this capability too.

I'm not a programmer, but I have a lot of experience with running landline BBS systems (shameless plug: The Frequency Forum BBS, Vienna, VA 703/207-9622). I've run systems that were written in Quickbasic, and in C. For most of the life of my BBS, I've run it in a multitasking environment using either Desqview or OS/2. This allows me to run more than one line on the same computer. Of course, it's important that the active tasks give up timeslices to the system when they don't need them.

There is a way to make a program aware of the multitasking environment, if one is in use. My current software can tell if it is being run standalone, or under OS/2, Windows or Desqview. Unless one node is actually doing something, sending data out the serial port, etc., it has no effect on the operation of the other nodes. I have to assume that this is related to the way the program responds to various system events and interrupt requests.

The effect of running a non-multitasker aware program on the system is quite noticeable. APRS is a good example. APRS behaves as if it needs always needs full access to the CPU's time. Other programs that are not aware of the multitasking environment behave in a similar manner.

OS/2, and to some extent, Windows, have the capability to detect when a DOS program is idle and reassign its time to other tasks, but it seems that APRS is never really idle.

My point: there must be a way to added multitasker awareness to APRS. I wish I could be more help, but not being a programmer I can't really give any more details. Maybe someone else here can.

Personally, I have never had any problems running APRS in the background other

Jack

gain
widespread acceptance. The old DOS version is still great for use on simple
8086
laptops for mobile use. Windoze version will be nice for WHizBang ,but will
take up
a lot more Horsepower. What happened to Bob's original idea of Keep It
Simple?
Good luck on the win endeavor anyhow, but don't lose the original reason for
APRS.

In KAM mode, aprs will shift to HF using ~a and shift to VHF using |a.
Some TNC's use a single stream switch character to "TOGGLE" back and
forth. They will NOT work, because APRS would never know which mode they
were in (without a little more code, which I have never writtennnn)

APRS has LOADS of free time when it is sitting there. All it is doing is
sitting in a tight loop checking the keyboard for a character and
cheeking the serial port. Since both have buffers, there is no urgency
other than once every coupla seconds to give APRS some CPU time... If
someone knows how to (in quick basic),
tell the operating system "take me, im done for a while", I could add
that in a flash....

This sounds like what you need Bob, I don't know how to call interrupts in
QBasic but it shouldn't be too hard. This is cut right from the Interrupt
List compiled by Ralf Brown. Someone with more programming experience
should look this over though.

Mark
KB9JMJZ

INT 2F - MS Windows, DPMI, various - RELEASE CURRENT VIRTUAL MACHINE TIME-SLICE
AX = 1680h
Return: AL = status
00h if the call is supported
80h (unchanged) if the call is not supported
Notes: programs can use this function in idle loops to enhance performance
under multitaskers; this call is supported by MS Windows 3.0, DOS 5+,
DPMI 1.0+, and in OS/2 2.0+ for multitasking DOS applications
does not block the program; it just gives up the remainder of the time
slice
should not be used by Windows-specific programs

when called very often without intermediate screen output under WIN 3+,
the VM will go into an idle-state and will not receive the next slice
before 8 seconds. This time can be changed in SYSTEM.INI through
"IdleVMWakeUpTime=<seconds>". Setting to zero results in a long wait.

In Visual basic, that's straight forward.

```
do
    dummy=doevents()
while not {test}

can't speak to QB, but I don't think it's as cooperative.
```

Sounds good so far. Will the map making utilities be ported over and
available for the beta test and/or general release dates?

> When asked about future plans, Mark said, "When we finish with the
> Windows version, we planning on doing an X-Windows version as well."

According to IBM, OS\2 code is about 75 to 90 % compatible with WIN code,
this was done in an tempt to help OS\2 to OPEN ARCHETECTURE. If this proves
true would it be to much to request an OS\2 version?

I'm sure the "tight loop" is the issue. There has to be a way to get APRS to remain idle except for a quick check for keyboard or serial activity.

I could get you the source for RBBS, the Quickbasic BBS I used to run. I think they had multitasker-awareness down pretty good. Let me know if you think that would help.

Bob

"Doze" toggle sounds good, if it works. Never tried to run it in a window so not sure if that is all that needs to be done.

I'd like to run APRS at work while doing other, less important things (like my REAL job).

Question about the F6 "QRT" toggle. Does it change your heading and speed info to QRT on the very next transmission or is there some type of delay?

And what is the best way to freeze the pos report? I don't want to have the car in the driveway beaconing my home position for midnight visitors. My icon as sent by the Shack APRS is 3 miles away from the real loaction. How can I keep the GPS going, keep APRS going in the car, but FREEZE the position a couple of miles before getting home.

Yes, call me paranoid, but I have had the visitors and don't want them again...

Ralph

 The PK-900 and I suspect the 2232 also use a |0 to select port 1
 (logical channel 0) and |A to select port 2 (also logical channel 0).
 It sure would be nice if Bob could support these find TNC's also.
 Note that either port can be hf or vhf on these boxes.

Hmmm... there's a programming resource out there on how to release time to
 Windows, but it was written when Windows 3.0 was new, and I haven't seen
 anything since.

What I did with DesqView is put APRS at a rather low priority compared to the
 rest of the stuff. It still worked, and didn't drag my poor little 386sx20
 into the ground as much.

Bob Bruninga splattered this onto /dev/hda4:

>In fact, several people have asked "Why don't you create PC maps?" or
>"I wish I could create maps that easily!"
>
>
>Well.. I am working on it!!!!!!!

And who's seen this MacMapMaker program? I was told that I could help beta
test in late May, then early June, and haven't heard anything further. I
have since started developing my maps on the PC and experimenting with the
PC version of APRS, a strange thing considering I really do like my Mac :-)

There are just a few things troubling me about this:

- The software is promised much earlier than delivered by Keith. I know
this is a hobby, but it's cruel to set an unrealistic delivery date. I
wouldn't exactly hold my breath waiting for this PC Windoze version of
APRS.
- The Mac maps, while higher in detail, are somewhat painful to maneuver
around, ie. no zoom out, no scroll sideways. The PC maps are quite easy
to get around compared to this.
- The main upgrades of MacAPRS are with the Ham callsign CDRoms. I don't
have a CDRom, and there are other programs that lookup callsigns. I want
APRS functions, not duplicate features!
- Does this mean the DOS version of APRS will go away/stop being supported?
I personally prefer the PC version of APRS at this time.
- Already thinking of X-Windows versions???

I get the feeling that the new Windoze version will be an awful lot like
the Mac version rather than the current DOS version. You guys who have
never seen the Mac version run might just want to take a look at how your
program may look in the future! Send your opinions to Keith now so that
the features you like will stay.

73, jan

Rendered body type: text/plain

Bob, would it be helpful if I check with some people "in the know" on Windoze
issues to see if there is a way for a QBASIC program to catch a Windows "lost
focus" (this is the way Windows tells a program that it isn't the foreground
anymore) and "got focus" (tells a program it's back in foreground) messages? I
don't know their official names (don't use them), but I do know a lot of DOS
programs do determine that they're under Windoze, and can respond to some messages...

246. eurmir 95 frequencies (fwd)

Here's authoritative information. EuroMir wasn't selected in a vacuum. We
need to recall that satellite and manned spacecraft frequency allocations are
the subject of TREATY obligations, and not subject to the whim and fancy of
your local coordinator or an arbitrary selection process.

One very good reason for it to run in the background or as an icon is that you will get updates, otherwise you will have major gaps in received information on a mobile transmitter. I usually run things full screen and so don't see the background process on screen, but having APRS not run in the background would kind of be like having your TeleCom program not run in the background.

As one of Keith's first beta testers, I have seen the way he develops a program, and it is different from the way Bob works. When Keith releases something, it works fully. He tests it quite a bit even before he releases it to the beta testers. That means a lot fewer releases, but a lot fewer problems for the users, and this is to be commended, not criticized. Like most of us, Keith has a job and a family to support. The program is a labor of love, and occupies virtually all his free time. MacAPRS contains far more code than APRS, and has been developed in much less time. Again, this is something people should be amazed at, and praise Keith for, not criticize him for.

> - The Mac maps, while higher in detail, are somewhat painful to maneuver
> around, ie. no zoom out, no scroll sideways. The PC maps are quite easy
> to get around compared to this.

Not quite right. When you open a MacAPRS map, the entire thing is displayed in the window, once you have zoomed in, you can scroll in any by clicking on a point, and choosing the 'Center View' menu item. There is also a 'Zoom out' item, but this has not been implemented yet, I would presume because I and none of the other users ever expressed a priority to Keith for him to do so.

> - The main upgrades of MacAPRS are with the Ham callsign CDROMs. I don't
> have a CDROM, and there are other programs that lookup callsigns. I want
> APRS functions, not duplicate features!

The different features Keith has added are too numerous to repeat here.

As a single example, version 2.0 allows you to use scanned maps, Delorme PICT maps, or any other PICT file as a map. There is still a bit of work to be done on this, but it does work. Everyone has different interests and priorities, and not everything that is added to the program will benefit you. Tough it out!

It's too bad you don't have a CD ROM, because maybe if you did you would appreciate the value of this feature. I won't waste bandwidth extolling these virtues, but I would say that if you are planning to develop maps, you are going to need a CD ROM anyway, so why not get it now...

> - Does this mean the DOS version of APRS will go away/stop being supported?
> I personally prefer the PC version of APRS at this time.

That would be totally up to Bob, but I don't believe he has any plans to abandon his program.

> - Already thinking of X-Windows versions???

Why am I not surprised that the humor of that statement was totally lost on you?

> I get the feeling that the new Windoze version will be an awful lot like
> the Mac version rather than the current DOS version. You guys who have
> never seen the Mac version run might just want to take a look at how your
> program may look in the future! Send your opinions to Keith now so that
> the features you like will stay.

The main reason Keith is taking on this project is that he will be able to make the windows version with the same code, using conditional compiles for the machine dependent stuff. I would guess the programs will look exactly alike! I too would encourage DOS users to look at MacAPRS...many of you probably won't want to wait, and will buy Macs now!

> ps. Yea, I know, this message is *loaded* with opinions. But I wanted to
> share 'em anyways...

I mostly just sit back and listen, I've found you learn more that way. But every once in a while, there is a message that I just can't let go by without adding my input.

> pps. Many thanks to Keith and Bob for all this great software! (even if
> they don't work the way *I* want them to :-)

Maybe if you provided input in a constructive way they *would* be more like the way you want them to work. I have found Keith to be extraordinarily responsive to my input, and I think MacAPRS is a better program for my involvement. That's a much better feeling than sitting there venting frustration at a volunteer effort!

Personally, I am not happy with Keith taking on the MacAPRS for Windows project. It is going to occupy much of his time in the coming year, which means there will be less time for him to add the features I want. But, maybe if more people start giving him a hard time he'll drop the whole idea!

Keep up the good work.

249. APRS 7.2 forgetful?

From: jeff.brenton@espi.com
Date: Tue, 19 Sep 95 00:08:17 -0500
To: aprssig@tapr.org
Message-ID: <9509190008.006ZR02@espi.com>
Rendered body type: text/plain

For some reason, APRS 7.2a doesn't remember where I am when I invoke it. What I mean is, when I start APRS, it thinks I'm at 0N 0W, despite the CF71.APR file having my correct location in two places (the bulletin line, and later in the file). I did not have to tell 6.9 or 7.0 where I was after saving the files...

Also, once I tell it where I am, it puts my symbol [square-zero] on the map immediately, but never updates it after that - that is, it "fades to grey". I thought it was supposed to keep bright, but mayhaps this is a misconception?

Hey. Great. For once poking a wasps' nest with a stick worked out.
Thought my original "hey how about Windows?" thing might have
been a little toooooooooooooo controversial but great to see the
overwhelming enthusiasm for code writing break out amongst you all
on here. Go Bob!
Glad to have been the catalyst for another era in APRS :-)

P.S. Hey, we're trying to do some serious mapping now.
Guys, retire that old 8086 to the corner and at least get a 386!
Yes, there is scope for a router only DOS code to do some clever
stuff - but APRS will only advance with the better machines!

APR REPLY: IF you are configured for any of the GPS modes, then APRS
will reload from a config file and ZERO your position. This is so that
a WRONG position report does not go out until your GPS updates.

I hope I have fixed the fade-to-gray problem in 73a I think.....

253. Anyone else built the GPS antenna ?

From: n2czf@gate.net
Date: Tue, 19 Sep 1995 17:39:39 -0400
To: aprssig@tapr.org
Message-ID: <199509192139.RAA25406@tequesta.gate.net>
Rendered body type: text/plain

Has anyone else on the sig built the GPS antenna shown in this month's QST ??
Any suggestions or tricks ??

I have most of the supplies gathered up and am almost ready to assemble one here
are a few hints/observations

If you cannot find or do not want to spend the \$\$\$ for copper layout tape GC Circuits does sell a pen that will adhere to any surface and provide a solderable pad or mark. We have one at the shop and I plan to try out one antenna with the pen method and one with the copper layout tape.

Instead of using RG-58/U how about some of the new Crushcraft Flexi cable sold with some of their low loss mounts (800 MHz and above). Be warned you will need a special connector or a lot of "careful luck" for the BNC. This cable is very low loss and works great but it is a bit smaller than RG-58/U so the connector will be a bit large. If you use a solder type BNC be careful and then "inject" the body of the connector with some silicone to take up the open space, this should avoid any breakage problems.
let's see if the loss is smaller (I am sure) than with the 58/U so that a MIMIC is not REALLY necessary.

And yes, we are going to try a MIMIC on the antenna in the near future, just got to find one in our junk pile\$. All three of us at work are hams and we all own GPS's so in the next few weeks we will be building 3 antennas, guess our boss will be the lucky one with the LAST antenna built and we will be redoing our own.

Any luck finding the proper hardware, ACE did not have that brand of nylon hardware. No washers either so I bought some extra nuts to use as washers but they end up either too thick or too thin. Guess we will be grinding down quite a few of them to come up with 5mm. Wonder what a light coat of spray paint will do to the character of the antenna ? THis will probably end up bolted to the fiberglass portion of my Blazer and would probably vanish from sight if it were black.

Realize that both the thickness and width of the strip are significant in stripline design.

ARRRRRRGH! If you're gonna "inject" it with "silicone" make sure it's one of the non-acetic-acid-evolving ones. Or kiss your connection goodbye!

I've had pretty good luck with BNC crimp connectors on the Cushcraft coax. HOWEVER. If you're gonna put a MMIC on the thing you're going to have enough signal to allow (most of the time and within reason) for the 1dB/meter loss of RG-58. So why bother with the extra hassle?

> let's see if the loss is smaller (I am sure) than with the 58/U so that a MIMIC
> is not REALLY necessary.

I'll be interested in your findings. I suspect they'll be skewed by the senditivity of the newer receivers, like the GPS45.

Depends on the paint, the dielectric qualities of the paint, and the thickness. A thin coat of most of 'em won't be too much of a hit...

Well as far as the copper I agree, but in today's workd this copppe tape is no too common in most people's shack. I am lucky the company that makes PC boards for my outfit is across the street and I see them about every other day so I am sure they can part with the tape... it they even have it anymore. COMPUTERS!

On the other points I totally agree, I guess I should not have assumed that everyone would understand. The paint I was unsure of but you confirmed what I thought.

I will let you and everyone know as I make them.

Copper tape is used heavily in making stained glass windows.
Try an art supply store or stained glass studio.

If you're really a butcher and hate to solder, I've used aluminum duct tape for shielding and for building quicky strip lines. Instead of soldering, I use conductive epoxy. It's amazingly stable as long as the glue behind the aluminum doesn't creep.

Ok, I built one. I used sheet brass-and the only nylon spacers that would come close to the suggested 5mm stack height were those from Ace Hardware. I modified the design very slightly by placing a BNC connector where the coax would pass through the bottom (reflector) sheet, and the center conductor went right through the hole on the antenna side. I played with the finished version this evening, and I'm afraid as of this writing I am not impressed. My Garmin 75 antenna seems to be better. I suppose it would be if the Garmin antenna has an MMIC amp in it, but I'm not sure if the stock Garmin 75 antenna has the amp! I am in the process of building an MMIC amp for the patch antenna to make up for the line loss. All in all, it does work. Just not as well as I would have expected.

The Central Illinois Balloon Assoc. (CIBA) is planning its third high altitude balloon launch on Saturday, September 30th at 9:00am. Rain date is Sunday, October 1st. The details of the flight are listed below.

Balloon: 1200 gram Totex
Est. max altitude: ~ 90,000 feet
Payload weight: 8.5 lbs.
Parachute: 7.5 foot dia.

Gas: Helium
Ascent rate: ~ 800 feet/min.

Radios: GPS data on APRS freq. of 145.79 Mhz.
Crossband repeater 147.585 Mhz INPUT with TONE of
146.2 Hz
441.025 Mhz OUTPUT

Call Signs: Balloon - N9WST-11
Crossband Repeater - N9XHJ/R

Note: The flight will contain two separate payload
containers.....one
containing the GPS/APRS equipment and transmitter and the
other
will contain the crossband repeater. This should
eliminate the
desense of the GPS equipment.

Stations watching the flight on APRS.....please drop us a line

Well people, if anyone knows of a good place to get the copper tape made by Bishop Graphics or GC in a small quantity post it here, if not I agree the conductive epoxy or the conductive pen method may be the easier way to do it.

I just went to my supplier of PC boards that is across the street from my work and they said that the conductive tape is hard to find nowadays. In these days of computers everything is done from CAD to Film and that it it. They did not even have any scraps from back in the old days. I know I looked around, I spend more time at their shop than behind my own bench!

Now where can I find a well stocked craft supply store hummm....

I called over to the fellow that runs our EMI certification lab, who also is a ham. He uses the copper tape to cover up RFI leaks during product testing.

He sent me a foot of the 1 inch wide copper tape.

Try your lab, if you have one.

Hey Guy's the 1 inch copper tape I use is for making tiffany lamps and small stainedglass windows. Give you an idea of alternative places to look? I haven't seen the article yet but the stuff I use comes in 1/4 to 1 inch widths and has an adhesive back I'm not sure if the thickness is what you need or not, but at least it's worth checking art or stainedglass hobby stores.

Hello all,

With regard to those looking for conductive tape, why don't you just use copper or brass sheet for the antenna parts instead of aluminum? These both solder easily to give a much more reliable connection than you will get with an adhesive-based connection. Brass sheet is readily available in my local hardware store (in several thicknesses). I happen to be using a sheet of hard copper because I already have it; otherwise I would use brass.

I also intend to seal the coax end with RTV after it is attached to the plates so that water can't get in. Losses are high at the GPS frequency even when the coax is dry!!

A simple alternative to the patch antenna:

I had an old Oak Bay remote antenna mount that was used with a handheld. This mount was a window clip with a BNC Connector, and about 6 feet of RG-174. The idea was to get the handheld antenna outside the car.

Well, I took the one I had and bent it up a bit and bolted it to a magnet. The GPS-45 antenna connects directly to it in the correct polarization. I then hook the other end to the GPS.

I have found the signals may be slightly down in strength (not sure), but I continuously track 8 Satellites when they are in view. It is FAR superior to the GPS somewhere up on the dash board and it allows me to hold it in my hand to make some changes.

Total time invested was about 15 minutes and I used an old magnet from a scanner antenna.

Here, where I work, we use conductive tape for EMC test and design. It's an integral part of what the EMC people do. They tell me that copper tape is available from 3M and presumably your local 3M distributor and they tell me of a company in Spencer, Mass called FLEXCON that makes laminates that pass for copper tape.

Try those sources if Copper tape is still hard to find.

N9WST/TPK 1.82 Msg #:7 Date:19-09-95 Time:21:43Z

The Central Illinois Balloon Assoc. (CIBA) is planning its third high altitude balloon launch on Saturday, September 30th at 9:00am. Rain date is Sunday, October 1st. The details of the flight are listed below.

Balloon: 1200 gram Totex
Est. max altitude: ~ 90,000 feet
Payload weight: 8.5 lbs.
Parachute: 7.5 foot dia.
Gas: Helium
Ascent rate: ~ 800 feet/min.

Radios: GPS data on APRS freq. of 145.79 Mhz.
Crossband repeater 147.585 Mhz INPUT with TONE of
146.2 Hz
441.025 Mhz OUTPUT

Call Signs: Balloon - N9WST-11
Crossband Repeater - N9XHJ/R

Note: The flight will contain two separate payload containers....one containing the GPS/APRS equipment and transmitter and the other will contain the crossband repeater. This should eliminate the desense of the GPS equipment.

Stations watching the flight on APRS....please drop us a line and let us know your QTH and signal strength.

Mark Elliott de N9WST@W9UUVI.IL.USA.NOAM

Can someone gate this onto hf so we all could watch it?

Actually, Digikey (1-800-digikey) has it, but I don't have time right now to get out the catalog. They also have aluminum tape. Both are used to EMI/EMC-proof devices in small numbers, or on the fly, at NASA.

> changed from GREEN to GRAY. Happened to me also.

ONLY WIDE-RELAY digipeaters now show as GREEN. This is because all WIDE area digipeaters should have TWO ALIASES. WIDE and RELAY. Everyone that sponsors a WIDE digipeater should convert ASAP to dual aliases. When this is done, there are 2 big advantages:

- 1) Mobiles may use the path of RELAY,WIDE no matter where they go
- 2) We can CUT DOWN on the number of wides! WIDE's should be WIDELY separated to reduce QRM and increase the range of WIDE,WIDE paths.
- 3) Lots of existing WIDE's and "EGOpeters" that are NOT truly wide area coverage can go back to RELAY only and still serve all MOBILEs and fixed stations.

>

DURING REPLAY, you have the option of DOTS only. If you leave that on, then you are stuck with dots, I think...

In response to someone's question about what TNC's can have dual ALIASES:

Besides the KPC-3, the Pk-12 and other AEA products have other calls, such as the "MyGATE" (bad name compared to the KANTRONICS Gateway) and the TAPR-2 clones can use NETROM. Most of the NETROM calls such as MYBBS, MYHOST, or MYDX will digipeat. The Pico TNC from PacComm will have 4 aliases!

IF YOU ARE THE FIRST IN YOUR AREA, then you can let the MY = WIDE and the MYA=RELAY. Then put the amateur call in the BText and set it to ID once every 10 minutes... You can also let another digi have the MY=RELAY and the alias =WIDE. But ONLY these two TNC's may cheat like this in any area. As soon as two TNC's have the same call, then posits will be confusing!

Also this is only a TEMPORARY solution, because with both calls being generic, you can NEVER specifically address either of these digipeaters by a unique call. So except by signal strength, you can never route packets specifically via those sites. But it is a temporary shortcut... to get the WIDE-RELAY concept going.

The WIDE-RELAY network really solves the problem for my 1 watt GPS tracker, because I can set the path to via RELAY-WIDE and it will work both around my house using my base station (RELAY) and around my work QTH which is near a WIDE (now also a RELAY). I never have to change the tracker's path. Also, when I go into the boonies, as long as I pass near some other APRS'er, his STATION will "RELAY" me into the network...

280. BETA test of 73b

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 21 Sep 1995 19:54:10 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950921183953.2792C-100000@greatlakes>
Rendered body type: text/plain

BETA TEST OF EXE73b.ZIP: Contains APRS73b.exe ONLY. I need some tests:

- 1) Im trying to behave better in the background under WINDOZ
- 2) I changed the code which sets up the video mode. Try 73b on CGA's and BW monochromes, and 8088 laptops, and be sure I did not bust it.
- 3) As soon as someone clarifies that calling INTERRUPT(22) will help in a multitasking environment, I will add that too, but I was afraid to put it in until I got positive info on its use...

IT IS NOT POSTED ON TAPR, cuz I just cant get my PC to upload it for some reason. It is therefore posted on 410 280-2503 BBS in the UPLOAD directory It is only 171K file.

Ver 73b: PRELIMINARY!

Here are the changes so far in 73b. Do NOT download it unless you want to try it out. It is EXE73b.ZIP which contains ONLY the APRS73b.exe file itself and not even this NEWNOTES.txt yet...

- * Now you can save the condition of the CONTROLS-LOG switch in the cfig file This changes CFIG file format. You can upgrade your 73 CFIG file by adding a COMMA and -1 after the 15 on the line about 22 lines down. Then copy the file to CFIG73b.APR
- * F-10 DOZ command disables all screen writes and puts APRS into a BLANK text screen. This may make it then run better in the background under windoz.. When returning to foreground most commands are safe, but it is best to first hit F10 or maybe one of the major screen commands.
- * Fixed the FIND-GRID-SQ command which got broke somewhere along the way...
- * Better discrimination of APRS MSGs for the TRAFFIC screen...
- * Fixed messages for your internal PBB5 showing up on READ screen
- * Changed Hurricane format to \$HC/www^ppp/BAR>RRR&rrr. See WX.TXT
- * Scalable Y Axis in 3D using F3/F4 keys
- * FIXES 73a bug in SPACE mode that sends LONG PACKETS Full of extra spaces!)
- * MOved SAVES back to bottom lines...

But I also piddled around with some little nitts, so need to have everything checked... Since I am NOT including all of the updated TEXT files, consider this only a BETA test.

GOOD NEWS:

One more thing that is in 73b and that is the ALTpath. This is under the

OPS-DIGI menu. Allows you to set an ALTERNATE path for your POSITION report and a percentage. Then randomly at that percentage, your position report will NOT go via your normal UNPROTO setting, but will be changed to the ALT-path. This is useful if you live in the middle of a string of digipeaters and want to let both ends of the string know you are alive...

Set your normal OPS-UNPROTO to the path of MOST of your activity, and then set the opposite direction in your ALTpath, and set it to 20% or something like that. Only the POSIT is sent via the alt path, since you can already send MESSAGES anyway you want..

BAD NEWS: It doesnt appear to work! ARGH. I overlooked it in my testing becaause I put that code in while sitting under a street lamp with my broken down car waiting for my wife to come rescue me. Ergo, I forgot to add that change to my list, ergo, I forgot to test it when compiled. Ergo, I just found it while playing with 73b, tested it, and back to the drawing board we go... hi hi

What about this (when you recompile to fix that):

Let the WX report also go thru an alternate path. Then my WX reports could go thru the local GATE, but my other junk would go thru a "local coverage" Unproto path.

And since I'm using the bandwidth- Bob, when does the rain counter actually reset itself? Top o the hour or every hour on the anniversary of booting the program?

Could the QRT command (F6) be made to freeze GPS position data? If it is going to be sent with QRT for the spd/hdg, then why not make it "freeze" your location, too. Sort of like going back to the trunk and unplugging the GPS (as someone suggested).

If my GPS transmit interval is 1 minute, is the program supposed to slow this down when it senses I am not moving?

Thanks
Ralph

REPLY: They do, a WX report is a POSIT report
>
> And since I'm using the bandwidth- Bob, when does the rain counter actually
> reset itself? Top o the hour or every hour on the anniversary of booting
REPLY: It is a running count. APRS is constantly comparing the rain
value to the rain value from an HOUR ago (every 6 minutes). (and for the
PRECIP field, from a DAY AGO (every hour)

> Could the QRT command (F6) be made to freeze GPS position data? If it is
> going to be sent with QRT for the spd/hdg, then why not make it "freeze"
> your location, too.
REPLY: to stop transmitting, use the CONTROLS-XMT to disable transmitting.
The QRT function is to eliminate your course and SPEED so that your station
does not continue to dead reckon on everyone's screen after you QRT your
station.
>
> If my GPS transmit interval is 1 minute, is the program supposed to slow
> this down when it senses I am not moving?
REPLY: It was intended to. But maybe I should check. I bet I never
implemented that or at least followed through to make sure that it still
works through all the versions...

So, then, can I have one path for normal operations set up (that my local
"chatting" messages go through), and another for my posit reports. This
would keep the chatting off HF. I have hesitated to put the WX out because
I don't want to contaminate HF with local keyboard stuff.

Yes, but that stops my posit report completely. I'd like the car to be on
screen, I just don't want it to wiggle around. It still wiggles even when
using QRT. I also like the position to be set (frozen) at the point I
pressed F6. Sort of like a software ON/OFF switch in the GPS transmit data
line. Cutting the TX off for the TNC would stop all transmissions.

>>
>> If my GPS transmit interval is 1 minute, is the program supposed to slow

Mine was transmitting like crazy (every 30 secs) when I went out to the
car the other night. I'd speeded it up so I could map a certain road and
had forgotten to slow it back down.>

Watch your local APRS screen closely next week, Bob.

Bob (and all),

I uploaded it to TAPR for those who need it, also I'll run the heck out of it this weekend under WIN95 to see what breaks.

Anyone in the area of Lake County (Illinois) Fairgrounds this weekend, 23-24th, drop in on Radio Expo '95. I be presenting an APRS forum both days at 10:15 (with Dave KA9NHL and Dan N9XHP). We also will have a "club" booth and information table using both DOS and MAC versions up and running.

Again a big thanks to both you and Keith for these programs.

I am trying to help my dad, father-in-law, K2AXQ , use APRS.
He gets the message:

o00PS, Error 5

when he tries to run aprs72a.

I was unable to find an error list in the readme files.
Does anyone have one or know where I can get one?

Bill, WB2LCC

REPLY: Yes, you can individually ROUTE each message, by entering /XX after
the T0 callsign. This will tell APRS to use the path XX from your OPS-DIGI
list for that message...

Someone stirred up a big fuss on the vhf reflector by posting a message on
a local pbbs stating APRS was going to use 144.180 MHz for 300 baud packet.
Since this frequency is in the heart of the weak signal section of the
2 meter band, some of the weak signal users are getting hot under the collar.
Hopefully cooler heads will prevail and if there really is a need to have a
ssb 2m packet APRS frequency, it can be established elsewhere.

Rendered body type: text/plain

A friend of mine who doesn't have Internet access asked if I would forward the following question to the SIG. It appears that when he runs APRS (he is currently on version 72D) that it changes the date stored in his TNC to an unrecognizable format. He is not running GPS or anything fancy, just the computer, radio and the KAM all mode TNC. His the text of his packet message appears below. I will forward all replies to him.

The APRS software scrambles the Kam's DAYU command which is for the date and time. "RESTORE.TNC" in APRS won't reset this because of the constant time and date change.
Here is an example:

```
KB2LML/V* > APRS 1F/25/FF 15:52:15
K04HD/V* > ID 1F/25/FF 15:54:47
KU0G-2/V* > WX 1F/25/FF 15:54:56
KA8ZGE/V* > APRS 1F/25/FF 15:55:09
KB8QEW/V* > APRS 1F/25/FF 21:28:24
KB8LLL/V > APRS 1F/26/FF 00:10:47
```

Also the program (72D) and TNC seem to lock up if left on overnight. I then have to reboot the computer. Any ideas?

{end of quote}

I can see some concern, if we were to use 2M SSB that would also mean that most of use would be avid 2M weak signal people also so I would hope that common sense would prevail.
I hear A LOT of FM here in the South Florida area and in the NY area there were many remote bases on FM in the area and that bothered me. I look forward to some weak signal packet but remember we are also doing weak signal, just because it is not voice does not mean that it is not weak signal, CW is also weak signal and much slower than packet. I do not now but chances are that we will also be using 1200 baud which make is much faster. When that time comes I am sure we will use good judgement and courtesy to our FELLOW SSB'ers on 2M. SSB equipment is not "a dime a dozen" so I would guess most of us will be seasoned VHF SSB operators.

GOOD news and BAD news

GOOD NEWS: You can get a 15% reduction in your COMPREHENSIVE automobile coverage by having an automatic ANTI-THEFT system such as LOJACK (or APRS!)

BAD NEWS: On my 3 vehicle insurance policy, paying at least \$800 every 6 months, the COMPREHENSIVE even on my newest vehicle is only \$14. So for a \$600 investiment in APRS tracker, I'd save \$4 a year.

TOO BAD! I was going to use this as an excuse so my wife would let me drill a hole in the roof of her new car...

301. APRS I/O Drivers (fwd)

Rendered body type: text/plain

Concerning the often asked question of making APRS work with BAYCOMS and other I/O systems, here is my response. If someone can identify a DRIVER that when loaded, LOOKS LIKE either COM1 or COM2 to the PC, then it should work transparent to APRS.

Here is the background. APRS was written in QBasic. Its only I/O goes through the COM1 or COM2 serial ports. Alll of the details are handled by the QBasic compiler. Here are the types of QBasic statements I use for example when using COM1:

```
OPEN "9600:N,8,1,CS0,CD0,DS0" for RANDOM as #1
PRINT #1, a$
INPUT #1, a$
LINE INPUT #1,a$
a$=INPUT$(LOC(1),1)
IF EOF(1) then...
CLOSE #1
```

Again, as everyone suggests, it should be "easy" for someone to write a DRIVER for the BAYCOM that looks like COM2. Good luck... hi hi

Message-ID: <199509231800.NAA22121@balrog.itek.net>
Rendered body type: text/plain

**** PLEASE DISREGARD PREVIOUS LAUNCH NOTICE! ****

The Central Illinois Balloon Assoc. (CIBA) is planning its third high altitude balloon launch on Saturday, September 30th at 9:00am. Rain date is Sunday, October 1st. The details of the flight are listed below.

Balloon: 1200 gram Totex
Est. max altitude: ~ 90,000 feet
Payload weight: 8.5 lbs.
Parachute: 7.5 foot dia.
Gas: Helium
Ascent rate: ~ 800 feet/min.

Launch Site: Washington, IL.
Latitude: 4043.048 N
Longitude: 8922.580 W

Radios: GPS data on APRS freq. of 145.79 Mhz.
Crossband repeater 147.585 Mhz INPUT with TONE of 146.2 Hz
446.025 Mhz OUTPUT

Call Signs: Balloon - N9WST-11
Crossband Repeater - N9XHJ/R

DF Teams will use the following freq. 147.255 Mhz. (+ offset) K9UQF/R
146.895 Mhz. (- offset) KA9IHD/R
with 103.5 Tone
146.515 Mhz. CAR to CAR

Note: The flight will contain two separate payload containers.....one containing the GPS/APRS equipment and transmitter and the other will contain the crossband repeater. This should eliminate the desense of the GPS equipment.

Stations watching the flight on APRS.....please drop us a line and let us know your QTH and signal strength reports.

Rendered body type: text/plain

I am running beta test version 73b in Windows-95. So far it is behaving nicely. It is very nice to again be able to write this email without having to first quit APRS.

For those of you who ask "why run a program in the background (or even suspend it) Have someone demonstrate Windows to you. The ability to multitask is great! I can be on the internet downloading a program, while at the same time watching a packet program. If I see a new call on packet I can look it up in Sam database, then come back and finish this letter. All this information can be seen on one screen, in "windows" of assorted sizes, or on separet full screen displays. You may switch between each application with a click of the mouse or via keyboard. There are of course other multitasking enviroments, but I believe " Microsoft Windows" tends to be the most popular. Shure it is great to have programs that take advantage of stand alone older pc's , I use those too!

Again Thanks BOB and all the others who help with APRS.

Charles

305. WINDOZ background

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sat, 23 Sep 1995 14:33:20 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950923142641.20471B-100000@greatlakes>
Rendered body type: text/plain

Stupid me, I thought "background" meant the program was hidden from view but still active. That is what I designed the DOZ function in 73b for. It goes to a BLANK text screen to eliminate any VIDEO mode problems while it may be running in the bacakground... Then when you bring it back to the "foreground" which I assumed meant "full screen", then you could hit the space bar and get the LATEST map re-drawn to see what all had happened while it was in the background...

Someone now informs me that "background" may also mean it is running in a smaller window so you can still see what it is doing while you are in the middle of doing something else.... This mode works if you configure your whole machine to 16 colors only, which reduces the capability of most other modern appllictions... So I guess DOZ mode does nothing here....

BUGS noted so far in 73b:

- 1) The ALTPATH in the OPS-DIGI command still does not work
- 2) Dead Reckoning no longer works??? I need to confirm this...

306. DELORME MAPS!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sat, 23 Sep 1995 14:41:36 -0400 (EDT)

Message-ID: <Pine.SUN.3.91.950923143328.20471C-100000@greatlakes>
Rendered body type: text/plain

OK, here is a VERY EXCITING challenge for you:

1) Delorme street expert allows you to add things to your maps and then to SAVE them as an "overlay".

This tells me that there is a FILE somewhere saved to your Hard Disk that contains the POSITION of the object you wanted added to your map!

ALL WE NEED TO DO IS FIGURE OUT THE FORMAT OF THIS FILE!!!

Then It is trivial for me to have APRS write out the location of all of its POSITS into a file on your HD in the DELORME format!

Here is the test. PLACE ONE OBJECT on your delorme map. Save it as an overlay. Use what ever tools you have available to figure out the format of this file...

Then PLACE 2 OBJECTS on your map and again confirm that you have figured out the FORMAT. If so, send it to me, wait a week, and BINGO, we will have an automatic APRS interface to DELORME CD ROM MAPS NATIONWIDE that does NOT need the current 2 computer, 2 serial port mechanism that we currently require...

Rendered body type: text/plain

> Concerning the often asked question of making APRS work with BAYCOMS

Unfortunately, writing a 'driver' to make a BAYCOM look like a 'normal' TNC is not that easy.. The 'driver' has to do all sorts of stuff including put the data into the format that has to go over the air, take care of the push-to-talk line, look at DCD for incoming data, put the bits together, check check-sums to see if the data is valid, etc, etc, etc...

This is actually worse than talking to a KISS mode TNC. However, there are some 'drivers' already written to make a BAYCOM look like a KISS-MODE TNC.

On the flip side of the coin, there are a LOT of advantages to doing APRS in KISS mode.. You can have the packets go out many different paths, dynamically change paths as conditions and needs change, and in the case of

- * Messages
- * Message ACKS
- * Query responses
- * etc.

The path can be changed depending on who you want to send the message to, (or send an ACK to) and in the case of queries, the path is chosen depending on where the query came from..

In the case of DUAL port TNCs (DSP-2232, PK-900 Kantronics KAM) the Mac version already only sends messages and message-acks to the appropriate band, later on, when I get around to supporting KISS TNCs, I will be adding the stuff listed above, HOWEVER, this will be quite some time before this gets implemented..

There are some 'drivers' for doing this type stuff being worked on by Tim Hayes, N2KBG (See the paper by him and Mark Sproul, KB2ICI in this year's ARRL DCC proceedings).

"Street Expert"? Delorme has Map Expert and Street Atlas USA. I have Street Atlas USA v2.0 and it does not have overlays.

Map Expert is a more advanced and sophisticated version of Street Atlas USA. I don't have it but I am familiar with some of its features.

I just got an upgrade notice for Street Atlas USA v3.0. I ordered it. Hopefully it has "overlays" - I know it has a lot of other new features that 2.0 lacked.

Hi Bob,

I thought it strange that you couldn't reproduce the problem...I had another ham try it before I emailed you and he got the same result I got. So I went back a played a bit. Seems as long as you enter a course and speed all is well....but if the depression is stationary (i.e. we both just hit return for course and speed, accepting the default 0's) then it comes up yellow. Does that give you the same result? All of this testing was done in 73a so if things have changed in 73b then it may be a moot point anyway. Thanks for looking into it.

315. 7.3b bug

From: HENRYVB@aol.com
Date: Sat, 23 Sep 1995 23:14:34 -0400
To: bruninga@nadn.navy.mil
Cc: aprssig@tapr.org
Message-ID: <950923231433_27586360@mail04.mail.aol.com>
Rendered body type: text/plain

here's a bug in 7.3b beta running under win 3.11:

if you press f10 while on the view packets screen, 7.3b gives the following error:

```
-----
***
LM,PM: 1      1
a,I,J,K,fdx,LDx:-1  48  0  78  0  22
X,Y,X1,Y1 41.97461 -77.18726  41.97461 -77.18726
A$ D
c$
ES$Finished RcvPkt
OOOPS! ERR number 5 Hit ENTER to return to DOS?
-----
```

oops is right. got it 3 times during testing.

otherwise, f10 on the map screen appears to work good so far under win 3.11

here's another bug, as long as i am writing. starting with 7.2d i noticed that i would get "your packet was not digipeated" (or whatever it says) messages on packets that DID get digipeated. it happens on several different machines, as i confirmed it today on two other users running 7.3a. what's up with that one?

thanks bob

Just finished building the patch antenna and am pleased by it! I had a Magellan Trailblazwe that had quit working and I suspected the antenna. When I tried the patch antenna it not only worked but locked faster than it ever did with the stock attena.

I also tried the patch antenna with my Garmin 45 it also locked faster. I did notice several things. It did better on sat's low on the horizon, signal strength changed more due to movment and obstacles than the stock Garmin antenna, and the speed and accuracy numbers were higher than the stock antenna. I'll have to try an MMIC amp next! All in all it seems to be a very functional antenna, which also worked okay on the cell phone; I'll have to cut one for those freq's and stash it in the rear window deck,

happens here too. As long as I'm writing: SSID of -2 used with gps tracker doesn't show a bus (I have to put {U} at the beginning of my BTEXT to show my bus). -2 alone shows a "dot" with a B inside. -9 does still show a car though (and -6 shows a sailboat;-14 shows a truck). I dont know about the other numbers.

Also, after I hit O,C,T to talk to the tnc, and then hit ESC to return to APRS, I get a message(line25) about "can't disconnect-Link state is DISCONNECTED" and a message in the upper right box about HSP mode being toggled back to tnc. I do not toggle HSP mode in the tnc blue screen, but it "acts like" I do.
73. Keep up the good work.

Doug, your so wrong, i just looked at my copy of the DeLORME street Atlas and if you read the license agreement it states in part as follows:

Printouts may not be reproduced in any manner for distrobution outside your household, bussiness or institution.

So if you just found that out by calling them you should have read the license aggreement first, i know many people don't bother to do that but it's there believe me.

A real can of worms there, especially if you have a single serial port
and want both GPS and the TNC. It can be done, but not without \$\$\$\$. What
specific equipment do you have and how do you want to use it?

Gee guys, we on the Mac have been able to run multiple programs for at least the last 5 or 6 YEARS. I many times am working on writting software, connected to internet, running MacAPRS, compiling a different program and reading email all at the same time. I regularly run 10-12 programs at a time and have had as many as 50 different windows open at one time (on a 20" monitor for those that think having 50 windows open is unmanagable, its not).

my \$.02 worth.

>Help!!
>Could one of you kind folks educate me on the art of connecting a gps/tnc to
>the apple powerbooks serial port?
>
>Thanks in advance

It's easy- here's a previous post to the group- the important point is that pin 8 (RX+) on the Mac side is floating- on many connectors, and on true RS-232 signals that swing from + to -, RX+ is connected to ground, sometimes right in the 8 pin connector. If you don't like the idea of leaving RX+ floating, then you can bias it high (about +1 volts).

(The Mac serial interface is RS-422, which is differential- a close approximation of RS-232 is obtained by using the TX- and TX+ lines, ignoring TX+, and connecting RX+ to ground. If the incoming signal doesn't go far enough below the level on RX+, such as the NMEA 0183 signal, the differential receiver doesn't see anything. This is why you need to either float, or bias high the RX+ pin. One easy way to bias RX+ high is using the voltage drop across a standard LED- about 1.2 volts. You power the LED (it won't light up) by diode or'ing TX+ and TX- together with small signal diodes (1n914 or 1n4148, etc.), and using that signal to pull up the LED through a 4.7k ohm or so resistor).

These approaches work for me with a Garmin GPS45 on my PowerBook 170, and on my Newton.

To connect the Garmin 45 to a Mac the following works well (at least on my PowerBook 170).

The easiest thing is to get a printer cable which has a couple of 8 pin mini DIN plugs on it and cut it in half. Identify each wire connection to the relevant pin on the plug and solder the Garmin 45 cable wires as follows:

Garmin cable colour	Signal	8 pin mini DIN
Black	Ground	4
White	Data In	3
Brown	Data Out	5

The pins on the 8 pin mini DIN plug attached to the cable are numbered thus when looking into the pins (sorry for the poor drawing):

```

  /-----\
 / 6 7 8  \
 |         |
 | 3 4     | 5 |
 |         |
 \ 1       2 /
  \-----/
  \       /

```

Are there any comments on Microsoft Automap Streets? (Windows 95) Just got it and am very impressed with it.

It is a 2 CD set. I am just starting out on this APRS, GPS, Maps, etc etc. Is there some form of integration with all this stuff now or down the road I can look forward to?

Rendered body type: text/plain

Im getting some feedback, but remember, I dont do windows, and I am ignorant of HOW you are using the program UNDER windows and what kind of FEEL it gives you...

So when you say it is working in the background, I need to know more...

- 1) Is this NEW? Did it NOT run for you OK before the DOZ mode?
- 2) Does DOZE solve any video incompatibility you had before?
- 3) One station reported he had to be in 43 line mode before DOZE... This didnt make sense, since DOZE puts it into the most basic of 25x80 line TEXT mode only...

The problem I thought I was solving was that everyone said that APRS DID work fine in the background as long as you set your PC to 16 color mode only. And they didnt like that because it severely restricted OTHER programs. Is DOZE solving that problem? Was that the problem in the first place?

What are the terms I should be using? I hear terms like:

- 1) DOS MODE
- 2) DOS window
- 3) FULL SCREEN
- 4) Background
- 5) Minimized
- 6) "in a window"

Im sorry to be so illiterate, but Id rather fix APRS than spend the time trying to convert all my machines over to windows right now and trying to get up to the level of expertise of so many of you hi hi....

I DO expect 73b to crash in the background until I go through the program and disable EVERYTHING that can possibly print to the screen, and I am sure that there are plenty... I didnt want to do this until I found out if I was on the right track or not... with this DOZ thing....

So can someone DEFINE the terms above into the SPECIFIC "modes" under which you would like to see APRS run, and what it does or doesnt do in each of those cases.. I would suggest that the person that wants to take this "hand-holding" exercise on, should tell us all so that you dont duplicate efforts, and so we all are starting from the same understanding. THANKS FOR YOR PATIENCE!! hi ih

I wasn't either. I get an icky feeling when a vendor tiers their products this way. Street Atlas seems like it is a crippled version of Map Expert. I couldn't believe it didn't have lat/lon. That's easy to do.

Jack

While we are talking about maps....

Ytou may have heard me mention City Streets for windows. This is a GPS
compatible disk based street atlas clone. The pgm is about 40.00 and comes
with one free region on disk (your choice). Additional regions are a few \$\$.

It had Lat/Long and allows placing of objects on the screen. It supports
ONLY the Rockwell Marco Polo pcm/cia card GPS.

I had been talking to Keith Hendricks, the Owner of Road Scholar Software
about our needs and had it under good authority that they were going to add
nmea gps support soon.

Well, it turns out that Etak, the people who make their maps has a choke
hold on Road Scholar. As I heard it from Hendricks, they may even take out
the Rockwell support. Story is that Etak makes the maps for one of the
vehicle direction systems (maybe that Sony/Avis thingie??). Etak isn't
about to allow any one else to threaten that business. So they are not
allowing *anyone* else to use a gps interface in conjunction with their maps.

I was about to write Hendricks & Co off, when I thought about asking him if
there was a way to feed some object locations to the pgm with a disk file ,
like Bob is doing with Streets on Disk, I think. He thought about it a
while and said tht is seemed like it would not be a problem with his Etak
agreement. Then he wanted to know who was going to pay him to develop this.

Folks, is it worth continuing to try to get this guy to support us?
Sprouls- What is your take on this?
He has claimed that no one else besides me has ever asked him for nmea
support. I know that is not true.

Should I just completely write him off?

Sure seems like the people that own the maps are really protective (Etak,
Delorme)

Ralph

Hi All,

This past weekend the Chicago Area APRS Users Group had a display at Radio Expo in Grayslake, IL. The next booth was the people at FAR Circuits, they make printed boards up for the projects in 73,QST and ARRL handbooks.

One thing lead to another so...by this weekend they will have in production the HSP board as shown in the GPS doc's, sized to fit in a DB-9, ready to plug the components into , cost \$4.50 plus about a buck for postage (they send you several in case you screw one up..grin).

I have some this weekend to test out but if you cant wait for my report or want one ASAP here is the info...

Bob Wrote

>Im getting some feedback, but remember, I dont do windows, and I am
>ignorant of HOW you are using the program UNDER windows and what kind of
>FEEL it gives you...

I ran 73b in the background of WFW3.1 at 50% opening it via a PIF. It worked fine as long as you sent it to the background while in the map page mode. It returned in the show via (D page) not a problem. It sent and rcvd packets fine. The only noticable difference was that at 50% priority the audio signals for new pos etc were longer than normal. I did not use DOZ. This basically lets APRS do its thing as you go off and use the machine for other things. It also ran in a <100% window but REAL SLOW.

Look at a 2 CD map program from Precision mapping. Good maps, Easy to print and add objects and it handles LAT and lon. Older version needs Lat/LON to be put in manually new version will take GPS input.

Here on a fresh monday morning, I began my mail reading by reviewing a copy of my request for assistnace on this windows thing. I was surprised how my use of capital letters DOES appear to be shouting when one reads such a message. SO Please understand that I am not shouting. hi hi....

I just tend to capitalize key words for emphasis. Starting now, I am going to try to remedy that, since I now see how it can be interpreted... My appologies to everyone who may have thought I was a yelling person...

Message-ID: <9509251858.AA03150@umed.med.miami.edu>

Rendered body type: text/plain

OK Guys, I think we need to start a discussion on the use of the limited bandwidth on 10.151. Before the flames start, let me say that I have read the APRS docs on this matter, but just plain disagree. I like APRS for its positions, and I want to see my map "cluttered up" with stations, including VHF station gating onto HF. Yes, there is a risk of tying up the frequency, but if you look at the raw traffic coming across the freq, especially at peak times, you see much more message traffic than position traffic. So the question is, do we want to see more positions or more discussions on satellite TV? I know what I want, what does the group want?

I feel it is beneficial to APRS to allow the VHF only stations onto HF for two reasons. First, those of us on HF will see more of the activity in local areas, and have a better feel for where APRS is taking off. Secondly, if we want to entice new users into APRS, and ham radio in general, we need to concentrate on that which makes us unique. With just about everyone (including my mother, arrrg!) surfing the web with 28.8 KB modems, using 1200 baud packet to access the local BBS looks pretty lame. APRS is a truly unique application of packet radio, and one that is ideally suited to attract new users. The thought that they are appearing on maps all across the country is a whole lot more exciting than just on a few computer screens around town, probably mostly people they already know.

There are a few things that could be done to lower the volume of gated traffic, without restricting VHF only stations from gating onto HF. First, Keith and Bob could incorporate a separate gate path into the programs. The programs would send out position and beacon reports with this path at a separate rate, set in the software, say 30 to 60 minutes, and NOT in response to ?APRS? messages. In this way a VHF station could mess around on .79 to his hearts content, and still know that his position was going out onto HF occasionally.

Remove the ?APRS? at the top of every hour in MacAPRS, or at least make an option to disable this. (I've been bugging Keith to do this for a while, but as QRM is getting more severe this becomes more important.)

Set some guidelines for keyboarding. I enjoy sending messages back and forth, but sometimes I see two stations going back and forth with dozens of messages, which I think is excessive. I would suggest that if you are sending more than 5 (or some other number the group feels appropriate) messages, that you tune down in the band with the other station, perhaps even making a second unofficial freq for longer keyboard ops. Another possibility would be to define a keyboarding time when these restrictions would be eased.

Change the way the PC version handles BLN# messages. In my opinion, they are sent out way too often. They should not go out in response to ?APRS? requests, and should be at a slower rate. MacAPRS has a counter that shows how many times each beacon and message is received, and many times I will see these 6 or even 8 line beacons more than a hundred times! Talk about QRM!

I hope this stirs up some constructive discussion among the sig. We have a very limited bandwidth on 10.151, and we need to come up with an equitable solution for all the various kinds of users of APRS. These are my ideas alone, maybe a little half-baked, but I think it is an issue that as a group we need to address.

OK, here is a VERY EXCITING challenge for you:

1) Delorme street expert allows you to add things to your maps and then to SAVE them as an "overlay".

This tells me that there is a FILE somewhere saved to your Hard Disk that contains the POSITION of the object you wanted added to your map!

ALL WE NEED TO DO IS FIGURE OUT THE FORMAT OF THIS FILE!!!

Then It is trivial for me to have APRS write out the location of all of its POSITS into a file on your HD in the DELORME format!

Here is the test. PLACE ONE OBJECT on your delorme map. Save it as an overlay. Use what ever tools you have available to figure out the format of this file...

Then PLACE 2 OBJECTS on your map and again confirm that you have figured out the FORMAT. If so, send it to me, wait a week, and BINGO, we will have an automatic APRS interface to DELORME CD ROM MAPS NATIONWIDE that does NOT need the current 2 computer, 2 serial port mechanism that we currently require...

Sorry, you are. MacAPRS now allows you to use maps made with DeLorme, but it doesn't use the CD direct. You must copy the picture of the map in street atlas to the clipboard, paste it into a graphic program, save as a PICT file, open in an application I wrote in order to set up the coordinates (the program takes the lat/lon of two points on the map and converts that into the info that MacAPRS needs to open the map. Finally it is ready to be used.

No-one can use the CD ROM directly, nor will they ever be able to. The data is highly compressed, in a proprietary format that Delorme will not release. If you notice when you run the program, there are patent numbers that come up, which cover the compression techniques that are used. If you were able to reverse engineer the code, you'd run smack up against the DeLorme legal department for using their patented algorithm! Pretty slick of them, huh?

As for the addresses, most mailers have a way to show more info about a message (h in elm) as well as a way to mail directly to the originator. Check your docs.

Rendered body type: text/plain

Aloha de Dave/WH6YC. I'm still experiencing the screen scrunch on my color laptop. It's been problematic for awhile. In an earlier inquiry, one response said he found a control panel that allowed him to resolve the scrunch and return APRS to fill the screen. However, the details were not specific and I was not able to replicate the procedure, or find the files, in my Compaq Contura Aero.

BTW, I used the Aero (color 486/33) while mobile recently in San Diego, and the display is not very bright to effective use it while mobile. The display on my Zeos (B&W) is much brighter and easier to see. Other than that, I had no problems with the laptop while mobile.

344. NO PRICES IN NEW RS CATALOG?

Date: Mon, 25 Sep 1995 16:20:11 -0400
To: aprssig@tapr.org
Message-ID: <950925162010_28805191@emout05.mail.aol.com>
Rendered body type: text/plain

Aloha de Dave/WH6YC. I recently gathered some data on the Trimble GPS that's built into a type II PCMCIA. I was pretty excited about the thought of using it with APRS, but the fact sheet and a call to Trimble confirmed that it does not output NMEA data. The cost of that unit was \$595. Trimble does have a NMEA-out GPS for \$495. That's list price, but still higher than a good Garmin 45 for \$300. Aloha.

346. Re:VHF/HF Gateways

From: Zonker@eworld.com
Date: Mon, 25 Sep 1995 13:45:45 -0700
To: aprssig@tapr.org
Message-ID: <950925134543_15502360@eWorld.com>
Rendered body type: text/plain

It seems strange that there needs to be much discussion on the topic of gatewaying traffic to/through HF. Maybe I don't understand the problem, or maybe I just don't understand APRS well enough? (In order to find out, maybe I should tell you how I think it works, and then folks can help educate me on the finer points...)

1) The HF gateways don't automatically send what they hear on VHF directly to HF. The gateway systems need to see "gateway" in part of the unproto string in order for the packet(s) to be eligible for forwarding VHF -> HF.

2) If "gateway" *is* part of the unproto path, *ALL* traffic from the station would be forwarded (messages, bulletins, as well as GPS and weather info...)

Now, as this is my understanding of how everything works (related to APRS gateways), my basic feeling is that "folks who gateways shouldn't send (many) messages!". Having said that, I'll add (in the same breath) that I can see applications where someone *would* want to use a gateway, and *would* want to use messaging. (Events covering a *very* wide territory, where VHF alone would be impractical, and Messaging could be used *minimally* to relay short traffic, rather than setting up an HF voice net.) It is for that reason that I think sending (a few, short)

messages an hour would be an acceptable use of HF.

Another use could be for events that are of interest to a large number of hams...tracking a hurricane, and an occasional message that states the category, and notes any HF Voice Net Freq designated for the storm.

While I enjoy seeing a few folks pop up around the USA on my APRS system, I usually watch my corner of the world. I do, sometimes, see messages to folks a *long* way away, and I realize that *I* can't send these other stations a message without setting/resetting my unproto strings, so I just don't bother chatting with them.

So, maybe we can find a way to minimize the extra traffic that goes via HF. (The Mac version allows you to set times for the various types of outbound messages...maybe there can be another set of checkboxes for HF-forwardability of those types of messages (i.e. to disallow bulletins, etc.) (This would avoid the need to constantly change the contents of the unproto string...which is impractical to do, for either the operator, or the computer.)

I haven't monitored the HF frequency in question. How heavily loaded is it, on a normal basis? Since there are probably very few frequencies available for HF Packet, we can either;

- really try to restrict our use, and preserve as much of the available bandwidth on the channels we have ("Shh! Quiet! Stop and listen to the silence!")
- use it as practically as possible. Then, if we saturate the channel(s) we have, we can examine how we are using the bandwidth, and try to allocate more if we find that the uses are good, or restrict the bad uses.

After all, we're all experimenters. While we don't have unlimited bandwidth in the HF bands, I think we can open a few more channels, responsibly, as needed. to help a segment of the hobby grow.

What are your thoughts?

>

The problem is that the channel is heavily loaded during peak times: all evening, and most of the day on weekends. There have been several bulletins lately trying to discourage VHF stations from using gates to get onto HF. The APRS docs (specifically OPS.TXT and HF.TXT) advise that vhf stations should not beacon thru the gates. I do not agree with this, which is the reason I think it should be discussed.

> 2) If "gateway" *is* part of the unproto path, *ALL* traffic
> from the station would be forwarded (messages, bulletins,
> as well as GPS and weather info...)
>

Right, and that is part of the problem. A separate beacon only path would allow an occasional position report over HF without xmitting everything. It might be nice to include WX reports at this frequency as well for station with automatic WX stations.

> While I enjoy seeing a few folks pop up around the USA

Mac APRS allows multiple maps at one time, so I usually keep a US map, South Florida map, and county wide map open at the same time. Perhaps this colors my experience, and the desire to see lots of stations around the country isn't as universal as I thought. With MacAPRS for Windows on the horizon, I suspect more people will experience this!

> So, maybe we can find a way to minimize the extra traffic
> that goes via HF. (The Mac version allows you to set times

Future plans for MacAPRS include a KISS driver, which would make this practical. Messages would be acked and responded to over the same path they are received.

>
> After all, we're all experimenters. While we don't have

Opening more HF channels really isn't too practical. There are few, if any, packet channels that are not already in regular use by one group or another, and moving on to them would cause friction. It would also limit some of the fun of HF APRS, where you can work everyone on a single channel. Gating would become more difficult as well.

Well here it is, i am in aw that there finally is someone that is in agreement with me on HF gates (Well sort of). I still have to ask of what use is it to VHF users to see those HF stations on VHF when we are not suppose to reply or put GATE into our unproto path. Well i'll tell you i have been starting to put Wide,gate,wide into my unproto since no HF users care of what we VHF users care about the situation. By the way HF'ers wake up with that new software available on internet called IPHONE you may be needing to throw away your HF gear. I have worked 15 country's in the last 2 weeks including Russia and Australia and most hams i talk to say their HF equipment is collecting dust since starting to use IPHONE. So read Steve's message carefully Hi Hi.

-- [From: Peter Gross * EMC.Ver #2.3] --

I too like to see where and whom other APRS stations are. Perhaps I'll recognize a long lost friend on my map someday. Even though I would like to see everyone from the vhf "side", it certainly is going to create a problem of the 1200 baud saturating 300 baud on hf. There has to be a limit somewhere and sometime soon. My main objection is seeing the vhf station and even some hf stations using wide,echo, or relay in their hf paths. There were complaints of using gate, wide, wide from hf. I am not sure why that was a problem but none the less all of the hf ops that read the bulletin did cooperate. Many vhf ops have never experienced hf APRS on 10, 151 MHz. They can't see it, therefore have no idea how they may be saturating the hf network. A new user usually hasn't had a chance to read enough of the docs to truly have much of an understanding of APRS. Most of the time we can identify him with "newuser" in the L-list. He needs to be educated immediately by an experienced op if he is doing something adverse to good operating. But to see the experienced ops intentionally disregard what the creator of APRS is inexcusable. Their excuse is probably that they too haven't read the docs. I have to admit the docs are long and difficult to absorb in one sitting but certainly if someone has any kind of interest he will eventually read most of them!

An idea once thought of would be to do similar to the meteor scatter protocol. That is where APRS stations in a specified quadrant of the country transmits during a specified quadrant of the clock. Therefore, perhaps on a certain day of the month APRS vhf stations in the northeast use a gateway onto hf. Perhaps on every Saturday another area of the country would gateway. Your thoughts.....

I agree with K04HD that the concept of vhf users getting onto hf and even back down to vhf is something that potentially will sell hams to try and stay on APRS.

One last thought...We all must be always aware of any type of emergency or anything worthy of priority to reduce frequency bandwidth immediately. This means that unattended stations should maintain a minimal path on or onto hf until they are present at their video screens.

'nuff said!

Yes ETAK is one of the leading systems in the Public Safety Industry, maybe one of the only ones really in use right now. There are others out there but I do not think they have the "pull" that ETAK has.

I do know that the Trimble system of AVL for the Public Safety Industry does use it and advertises it quite a bit in a trade journal called "Radio Resource".

Rendered body type: text/plain

With regard to the newest discussion on the HF GATEway system:

I think it is the responsibility of the GATEway operators, individually, and as a group to maintain the HF traffic throughput to the APRS HF Net.

Each GATE operator exists in a unique subnet of the entire APRS system. Where I live, there are about 7 regular VHF users, most of which have

never used my GATE to go onto HF but whom have told me they appreciate seeing the other HF stations and GATES appear on their map.

I think a realistic standard should be discussed, established, and then adhered to with regard to gateway operation.

Denying access to anyone not engaged in GPS mobile operation is, in my opinion, overly restrictive, yet, having a free for all is undoubtedly too much.

I would suggest that VHF users who are actively at their station consoles be permitted to beacon via a GATE if they wish, with a limitation of using no more than one digipath, for the purpose of encouraging keyboard conversation.

Unattended VHF to HF beaconing should be prohibited as it serves no real purpose. Unattended VHF stations would still receive bulletins and users who know they exist could still send them mail at a PBBS via standard packet connection without beaconing their posit..

This would limit unnecessary beaconing and map clutter while encouraging maximum APRS usage.

However, in large metro areas with large APRS user populations, I would suggest the GATE operator use the BUDLIST command to restrict incoming HF beacons to specific stations and digipaths in accordance to local wishes.

And finally, if a local emergency arises, turn the darn gate OFF. If you run an unattended gate, turn the remote access commands on and share the password with someone you trust in the emergency organization so they can turn it off in your absence. (simple command...0 C T cmd: MYGATE NONE)

Just a few thoughts, how about some input?

Dave-

I posted that message. My Compaq 388 LTE 25MHz mono laptop was in the shop getting a new hard drive installed and I was using a Thinkpad 750 by IBM. It had the dreaded scrunch. I found in the Thinkpad's setup screen, a choice to "Expand Video Display". Once I did that, the display was full screen.

As a note- I now notice scrunch on the compaq. Being mono, I guess I thought it was supposed to be that way. I couldn't tell the diff between the edge of the APRS screen and the blank area caused by the scrunch.

**** HELP NEEDED*****

Here I sit in Annapolis, proofreading typos in APRTrak with Mr Bob. (Cool program, by the way)!
I loaded up APRS under windows in a lab machine, and he and I have been playing with it. I am running it under a "pif", albeit the one with default info. Bob Baltz- what are your parameters?

These machines are running Win 3.1 (not workgroups)

Video card is a Weitek 640x480 with 32,767 colors (seems crazy, but that's what the driver says). I am not sure if I can locate the windows disks here to try different drivers.

Those of you playing with APRS in the background- please give me the setups you are using. Bob and I will play with APRS in the background. Lets not miss this opportunity!!!

For the record, with the setup mentioned above, APRS runs fine in the foreground, but in the background, it gathers no positions.

I'd like to be able to dead reckon along a user-defined path. This would be very useful for two events I'd like to cover with APRS, namely a car rally and a mt. bike race. Both of these events are run along a pre-defined course, which is nowhere near straight!

In the case of the rally, about 5 cars are on the course at anyone one time (staggered start), and they're going approximately the same speed. I get voice updates of when the cars pass various checkpoints from other Hams along the course. I found it too hard to "move" the cars manually from the updates, and dead reckoning has the cars go "off the course".

I'd like to be able to create a path with the cursor, then attach an object to it. Maybe instead of the "COURSE (000)?" prompt during object creation, you could reference some path name? Then the object would follow that path and stop at the end (and sound an alarm?)...

A feature like this might also be useful for other things, too. And maybe a "make path from GPS track" feature to aid in creating paths? Tuesday morning and already my mind is running amuck! :-)

If there already is a way to do this, or get around this, please let me know...

The default PIF should work fine, provided you have background execution enabled, and you are running APRS in a full screen and not a window.

APRS should also work in a window, but it might be slower and there may be problems with the graphics. You can play with the font setting to get different window sizes.

Rendered body type: text/plain

First one general comment: Every PC within range of our local HF GATEway fills all 5 APRS pages in only about 2 hours on weekends and in about 6 hours on weekdays. This means, we are already seeing the full capacity of APRS. As soon as APRS sees *one* more station than 80, it begins bumping stations off the top of the list and adding new stations at the bottom. The problem is, that that *one* station tha got bumped off, then re-appears 20 minutes later as a *NEW* station. Ergo, he gets added to the LOG file and the TRACK history file. This results in TRACK HISTORIES and LOG files being written about every hour or so. Soon the HD disk fills up..

Yes, this problem does *not* occur on the MAC's, but is a significant problem on the PC. One soultion is just more pages of memory so that active stations stay on the lists, and dont keep getting re-added as *new* stations every time they transmit... But already, 80 stations are more than I can personally keep up with.. What is the upper bound of the human condition? hi hi

So listening to HF10151, I dont hear *any* dead time where more stations could be accomodated... Remember, that a CSMA channel like PACKET must have about 60% DEAD AIR time inorder to support OPTIMUM throughput. As the usage goes above 36%, collisions and errors increase dramatically and overall throughput goes *down*.

The thing to do is to bring up additional nets on the 40 and 20 meter bands...

This is the what I have been using also and works well. I found you must send to background from map screen. Does not work sending from other screens.

Also you come back to D screen (not a problem).

APR REPLY: My technique as a consumer, in RADIO SHACK and anywhere else that I find items WITHOUT PRICES, is to take HANDFULS and CARTS FULL of the items to the check out counter. Then ask the clerk to scan them.

Then as each price comes up, say "Nah, too much..." on everything except the one thing you came to the store for.

THEY THEN ARE LEFT WITH A PILE OF STUFF THAT THEY HAVE TO RESTOCK. At least by handling it, they may put it back with a LABEL!

I FEEL IT IS MY DUTY AS A CONSUMER to do this EVERYTIME I visit the store... I can be a real pain-in-the-@#\$\$ as a consumer...

FROM: xxxxxxxx

TO: APRS@USA
SUBJECT: **NEW** APRS VHF SSB FREQ.

FELLOW APRS RUNNING HAMS,

THERE IS A NEW 2 METER SSB FREQ. FOR APRS USAGE. THE FREQ. IS 144.180MHZ. UPPER-SIDE-BAND. THIS IS A SET FREQ. ALL TRANSMISSIONS WILL BE 300 BAUD JUST LIKE HF. ALL SETTING IN APRS WILL BE FOR HF EXCEPT FOR THE UNPROTO VIA GATE. UNPROTO WILL NEED TO BE SET TO VIA WIDE NOT WIDE.WIDE.PLEASE SET YOUR ALAIS TO WIDE TO GAIN MAXIUM RANGE. AND MAKE SURE YOUR USEING A VERTICAL ANT.

THE REASON FOR AN APRS 2 METER SSB FREQ. IS AS FOLLOWS.
1> TO GAIN FURTHER RANGE.
2> TO PROMOTE MORE USE OF THE 2-METER SSB FREQ'S.
3> TO AID IN CASE OF AN EMERGENCY.
4> TO ALLOW A FURTHER GATE FROM 145.790MHZ.
5> TO PROMOTE GOOD-WILL AMONG HAM'S STATE AND WORLD WIDE.
6> TO ALLOW NO-CODE HAMS, WITH THE HELP OF CODED HAMS, TO LEARN HF PACKET TECHNIQS.

ALL HAM'S WITH SSB RADIOS ARE URGED TO OPERATOR ON THIS FREQ. ENJOY AND PLEASE KEEP ON APRSING.

I repeat. WB4APR disagrees with this message 100%

This is exactly what i'm talking about, tell me what about HF gates serves a
real purpose then outside of GPS beacons?. Really now what gives the HF
gate user or station the right to fill my screen with Bulletins of no value other
then that person wants to make sure his message gets send over and over!.
I still say if i see gates or HF users appear on my map Budlist or no Budlist i
will also attempt to reciprocate by using that gate to HF, what's good for HF
users is good for VHF users.

Now don't me wrong IF the HF user was using the Gate for what it was
intended for that would be another story. If you read the docs it states
that it was strictly setup for GPS Mobiles and Boats to beacon their
position back home so the family or xyl could see their position. All HF
users have lost sight of that fact. I have seen HF users continually use
the Bulletin function to send messages back and forth, and all this was
during one of our heavy weather situations when a tornado took a 3 mile
wide path 30 miles long just 4 miles south of me and i was attempting to
let everyone locally know about it's path. So don't tell me that HF users
have the right to beacon onto HF but VHF'ers do not have the right to go
the other way!!!. I have attempted to explain this in the past but nobody
cares about this. As i stated before i have worked hard over the last 2-3
years in coordinating 145.790 in theis area and i have what looks like the
only coordinated digi in the surrounding 3 states. So please don't tell me
what i can or cannot beacon trough my digi. This may sound harsh but i have
not had any cooperation to speak of nor aggreements that the beaconing
would stop during a heavy weather situation. Therefore i will use my digi in
any way i see fit, and for whatever i feel helps the local community.

Rendered body type: text/plain

Regarding my previous message saying how BAD it would be to operate 300 baud HF style APRS packet on 2 meters in the *weak_signal* portion of the band,

I should have also said: "But I do endorse any ham doing any kind of experiment that he wants, as long as he takes into consideration other users of the band."

In this case, if those stations want to do some of these experiments, then choose an appropriate frequency. I would suggest using your existing 2m FM APRS channel! The length of the packets should be no worse than the typical APRS FM packets, since on SSB, there should be no DIGIPEATER field making the packets 30 or so bytes shorter and since they are NOT digipeated, they take less than HALF the air-time. The channel loading by those SSB stations will be similar as for FM at 1200 baud.

Now there will be the usual "thought police" who will jump all over you for using SSB on "their" APRS FM channel, but I think they should be more openminded and permit anything within reason for the sake of amateurs being experimenters...

Tough question...sometimes I think there is no limit, other times I
think we are way over the line already, HI.

Yes! This is the whole point. We have to reduce this traffic. The
question is how? Do we turn off all GATES? The question I have for you
is how much of that 40% should be ragchews, and multiple copies of BLN#
bulletins? I don't want to make this personal, but there was a station
announcing a special APRS event, that ran a BLN# series of 5 or 6 lines
for a week or so, and I recieved more than a thousand copies of most of
the lines! This is NOT a comment made against the station, which will
remain nameless, but a question of how the protocols are implemented.

Bob, I would like to hear your specific comments on these points:

1. The idea I threw out for a separate GATE path, so that VHF stations
could put their position through a gate once or twice an hour, without
putting all the other stuff APRS generates onto HF.
2. Modifying the BLN# protocol, so that these beacons are sent at a slow
rate, say once or twice an hour, and not in response the ?APRS? message.
3. Setting a voluntary limit on the number of messages a station ought
to send to another station per hour before they ought to move off freq
for a ragchew. Perhaps the program could even tickle the user if this
rate is exceeded.

>
> The thing to do is to bring up additional nets on the 40 and 20 meter
> bands...

>
I don't think this is an answer. Someone would want to put up an HF to
HF GATE (no reason it couldn't be done) and things would really go nuts!
I feel a better plan, at least for the short term, would be to make
better use of the 36% of the channel we are using now.

> -----
It is unrealistic to expect a user in some distant state to know when
you are experiencing a heavy weather situation and change his path
accordingly. What needs to happen is the GATE operator in your area
needs to turn off his HF radio during such a situation, eliminating the
traffic from your area. Eliminating HF gates is not a good idea IMHO.
The ability to see a lot of stations from distant areas attracts a lot
of new users to APRS, and will help YOU recruit more people for your
weather spotting activities.
>
> >Unattended VHF to HF beaconing should be prohibited as it serves no real
> >purpose. Unattended VHF stations would still receive bulletins and users

> >
What is the harm of a station putting his position over HF once or twice
an hour? I agree that stations shouldn't put gate in their usual paths
during unattended ops, but what if there were a separate path that gated
to HF once or twice an hour?

The gate function is embedded within the TNC. I have toyed with the idea
of writing code to tie two TNC's together to give more control over the
actions of a gateway, but it is way down on my priority list.

Steve, K04HD

Thanks Steve -

Here's my incentive for asking the question:

KAM - \$300
2 x MFJ1270 - \$230

Seems like an easy choice if you don't need to have tty, amtor, cw, etc,etc,etc.

Provided, of course, that the code is there!!!

:-)

I have a TAPR TNC2, and was wondering if there is an updated firmware with
the GPS mode available. I checked the TAPR files and did not see any
reference to new firmware. If anyone knows of any please let me know. I
have an EPROM burner so just the data would be great. Thanks

BLN# transmissions being slowed down to allow more time for position
reporting...etc. Forget it.. If you are trying to get the word out about a
tornado passing through the area, you want your bulletin to be transmitted
as many times as needed to alert everyone on the system involved to receive
it.

I do have a suggestion, limit the transmission of bulletins to just 2
hours. This would eliminate those expired bulletins from continually being
transmitted as I have noted here.

Personally, the some of the HF BLNs that end up on VHF drive me nuts. Some days it seems like I can't hit a key on the APRS machine without another BOO DOO DEEP new bulletin alert every 10 minutes, then I go to see what's up, and there's a new BLN bulletin about the football schedule on TV, politics, or some other garbage that I don't need to see.

Perhaps we need some general guidelines about what's appropriate for the BLN feature. For starters-

- APRS network equipment failures or related notices
- Upcoming APRS events, public service events or t-hunts
- Emergency notices, storm warnings, other priority traffic

Anything that will not be of interest to a large number of users, over a wide area, is probably not appropriate. Just my \$0.02...

Message-ID: <199509270123.VAA113820@tequesta.gate.net>
Rendered body type: text/plain

Oh so true!! I kept my mouth shut when I saw all sorts of BLN's that had nothing that even REMOTELY related to APRS, or even Ham Radio! I am glad that someone else felt the same way as I did, when I saw the comment about Football I just had to put MY two cents in since that really rubbed me the wrong way at that time when I saw it.

While on the subject.... people we are going to see a lot more of these problems face it we have reached a size where many have different oppinions and many

will not conform or even listen. We just got to do what we think we must and try to keep peace among EVERYONE! We will lose a few, I know we will, we already have over the years but we will also gain a few and someday maybe welcome back others that have left.

I have mixed feelings about gateways, I run one myself and feel that if it were not for all the activity on HF coming thru to VHF we would have ZIP, nothing, nada on VHF here in the West Palm Beach area. We are just not strong enough to support enough interest with just VHF users, if that day comes I will probably give my \$2500 investment in a HF rig and TNC a rest often. Till that day comes I will support the GATE 100%, I do not like everything I see but it is for the best at this time. Can we use some changes, yes we can I see a LOT of good ideas out there on the sig and I hope to see a few of them in use in the future.

Recently with the addition of another WIDE digi (1 week old) it seems that we have coverage now from Melbourne to Dade County/Key West 99% of the time, maybe we will not need the HF gate all the time VERY soon. I myself find many problems with the VHF net also somewhat like we have on HF but on VHF with the WIDE's . Some of the users to the south feel that the more WIDEs up the better even if they are 5 miles from each other and cover the same 8 mile radius! This is a bit overstated with the range but the problem is still there, WIDE's 10 miles from each other and with a beacon path of WIDE,WIDE,WIDE. U think u have problems on HF??? take a listen to 5-6 WIDES in a 30 mile area of each other and with that UNPROTO in ADDITION to about 30 or so APRS users with various UNPROTOS from WIDE to 5X WIDE!!

One very active user and highly respected one differs in my opinion that this is poor judgement, we will fight like hell about the subject but neither of us will bow down from our opinion. He is a GREAT person but it is making MANY people unhappy, and all the new users are taking his word as gold making the problem even more difficult. Did I expect this ?? yes.. do I expect it ?? yes.. will it happen on other subjects ?? yes.. welcome to the wonderful world of people that is what makes ham radio fun LIVE WITH IT AND DO YOUR BEST!!!

Message-ID: <Pine.SUN.3.91.950926213434.28555A-100000@greatlakes>
Rendered body type: text/plain

First of all, Bill let me complement you on an excellent set of STREET level maps of Huntsville and Gadsden Alabama! Ralph Fowler was passing through and showed me a few... Congratulations on figuring out how to do the USGS mapmaking at 100K!

Pretty soon you should consider putting together a ZIP package of ALmaos01.zip for distribution! Be sure to follow the instructions in the MAPS.txt file... Thanks

Concerning your latest ANGRY letter... Your threats to react to others mistaken operating practices by QRMing other stations with poor operating practices of your own does not reflect well on the amateur spirit... Sit back, relax a little bit....

It still seems like you do not understand how gates work....

1) What you see on your screen coming in via an HF gateway is coming in through some gateway in YOUR area. If you are operating a special WX net, simply ask the GATEway operator to disable his gate for a while....

2) The HF channel is only 300 baud and it is FULL. Even if the HF channel is 100% full nationwide, the most it can add to your local net is 25% of your local 1200 baud channel... If you or other VHF stations begin routinely beaconing your VHF stuff through your local GATE onto HF, then only 25% of your users would be TOTALLY SATURATE the HF NET nationwide! Now multiply that by 100 other cities like ATLANTA, CHICAGO, BALTIMORE, and every other city in the country and you can easily get to the hundred TIMES 100% overload on HF..

3) This does not mean that it is *wrong* to beacon from VHF to HF, in fact, I will do it if ever I go on a long trip. But it simply means that each station should consider the bandwidth available and decide if his packets for each event are worthy of adding to the narrow HF channel...

3) You should be able to solve your problem with a simple phone call to your local GATEway operator there in Huntsville. Dont try to change the operating habits of everyone in the country to solve a local problem...

Good luck. I do appreciate all your efforts in getting APRS off the ground in the south. Also, now I am looking forward to my next trip (this XMAS) to Florence and passing through your digis...

Hi Bill- I thought I saw you on HF up here in Annapolis. Nice to see you finally embracing the Gate concept and HF. I don't see any problem with you sending your position a couple of times an hour.

I'm a bit troubled by your statements about having the only coordinated digi in 3 states. Are you familiar with the way digital is coordinated in the SE states (besides your state)? SERA, the Repeater coordinator does not coordinate packet, but there is a packet coordinator who works *with* them (at east in GA). In GA it is Randy Jarrett WA4MEI (who happens to own an Internet provider Company, by the way).

There are *many* other coordinated digis besides yours (and who coordinated yours, by the way? I wasn't aware that the Alabama Repeater Council did packet.) I know they have a technically deficient approach to coordinating voice repeaters, with their 25 year old mentality 20 KHz bandplan on 2 meters!

BTW- I showed Bob Bruninga your maps. He liked them a lot. Said that they were the most thorough (and large) of any he has seen lately.

Ralph

Rendered body type: text/plain

Bill wrote back that he has been unable to find out who the local GATEWAY operator is in his area. And this makes a good point! So I am replying to the SIG so maybe others can benefit. Here is the problem:

The problem is that the GATE is usually a KAM. And when the KAM is running with APRS, the owner must select either HF or VHF for his posits. This means that although the GATE works both ways, HIS posit and beacons will only show up on ONE band. So, if he has chosen to operate APRS with his KAM on HF, then he will NEVER appear on VHF, although his station is GATING everything on HF onto your VHF net...

My KAM gate in Annapolis is operated on HF. This means it NEVER shows up on any VHF map. Often, though, I have another VHF TNC at the same site running on VHF and it usually has the Gateway symbol... but not always...

SO here is the solution (and responsibility) for GATEway operators (I hope this works...):

After APRS is running, and the TNC is all initialized... use the O-C-T command to talk to your TNC. Then tell the KAM to set BEACON every 0/20. I think this will set BEACON to 0 on HF where APRS is running things, but it will also set the BEACON to every 20 on VHF! So now, the posit WILL show up on VHF. Maybe you can even add this to your INITTAPR.TNC file!?

I guess I can add this to APRS code...

In the meaqntime, since we GATE operators ARE responsible for the load we are placing on our VHF networks, we *owe* it to our fellow VHF'ers to show them who and where we are...

P.S. If you are acting as a gateway but you are operating your KAM on VHF, then there is no problem, because your VHFers are probably not using your GATE to put stuff on to HF so the HF'ers don't care where you are... But again, it wouldn't hurt to put BEACON EVERY 30/0

Thanks Bill for raising this issue. I think we all assumed that you knew who your local GATEway operator was...

Well I'm SHOCKED! I thought I was going to read a new juicy tidbit about the federal trade commission and Bill Gates at war with each other. WRONG Gates war! Still what I've seen while entertaining dismays me, with proposed changes and the hungry hordes with more cash than any mines better than yours ham's, clamoring and waving cash in the Fed's face for your bandwidth; I'd say it's time to focus on the only two reason's to justify not selling off the bandwidth they haven't gotten their hook's into. Public Safety and experimentation! I kind of wished Bob would jump in and reaffirm the original purpose for slaving over the birth of APRS. What were the sample hst files that he provided? Sea going vessel's, parades, public events, gating through HF so the family knew where he was. Public Service is where it's at!

I don't mind weather station's or mobiles gating through HF to VHF but come on here I read about bullitiens and messages being gated! Unless these have

a wider signifigance for public saftey I can't see the justification for it other than statisfying ego.
As to experimatation; Bob used his privilege to operate and an idea and created a beautifal baby! He has always stated the benefits and downfalls of this idea.
I work in city goverment and we are doing a study of electrical buses; for the last year we ran GPS AVL on the bus diesel fleet along with operating data, (oil temp's, gas flows ect) and now have equipped the electric buses with the same package. The point of all this is the software is not as good as APRS, and I have the city ready to evaluate APRS as an alternative. That's what it's also all about using the hobby to show the commercial big buck boy's that there is a better way to do it!
I'm not a ham!(my brother is) I get to play on goverment freq's; so I think I'm a little impartial here. I expect to get flamed some and that's all right. I'll just leave you with two quotes I think will help in these discussion's.

What benifit a man if he gain's the world and loses his soul (freq's)

Pride comes before fall and destruction before a haughty spirit!

barrettd (^-^)

REPLY: NO. Intention of BLTNS is to get the word out. It has to be at least every 15 to 20 minutes to accomodate new stations on a net. Remember that APRS was desgined for local public service nets. I DO like the suggestion that someone made to have them die after 2 hours, but again, on an HF announcement for something like the last Meteor SHower experiment, that 2 hour limitation would have made it impossible...

> to send to another station per hour before they ought to move off freq
> for a ragchew. Perhaps the program could even tickle the user if this
> rate is exceeded.
REPLY: I am a conservative and generally dont like restrictive laws to legislate stupidity... APRS has some good legitimate uses, and I hate to cobble that potential because some users just never think about the big picture... We have to live with sloppy operating practices on all the bands and modes, and try to educate individuals as needed...

I dont begrudge the HF guys chatting. IN fact, even with 80 stations on my LOCAL map, about the only chatting going on is on HF, and without them, I wouldnt see much. But I agree, that when they are really going back and forth on a LONG ragchew, they SHOULD change their path to NONE, so that it STAYS on HF only...

And while IM at it. ALL stations should re-think their BULLETINS! I agree that 90% of the ones I see could be said in ONE or 2 lines instead of 8!

And if you are going to put out UPDATES to bulletins, RE-USE the same BLN numbers so that we dont end up with a screen full of old bulletins where only the latest is important! etc. etc..

386. VHF<->HF Gateways

From: jeff.brenton@espi.com

The questions and suggestions about HF gateways brings up a suggestion I *think* I made some months back, but I'm not sure...

Howzabout implementing support for Kantronics' Remote SYSOP function in APRS and MacAPRS? I posted the code I use for automatically logging in, written in Crosstalk's CASL script language, back when I got it working. I use it under OS/2 or Windows by opening a Crosstalk session, either the DOS or Windows version, and telling it which remote to log into... it handles the password prompts for me.

An ideal place would be Ops/Comms/Remote...

Also, on the subject of going to 10m when possible, and running 1200 bps, those of us with KAMs are limited to 300 on HF, so the idea of using two less expensive TNCs, with software in between to regulate the gateway function, would be a much better option for 10m.

387. No Activity - SoCal

After playing with Bob's software a bit and then sending in the bucks for his kids.. I have found next to NO activity in SoCal...
2 or 3 stations may POP up in the San Diego area but NOTHING in LA/Orange County.... unless their hiding out on some remote frequency (VHF)

Nope, prices in our new catalog, your probably right, they didn't want to print a special edition with different prices entered just for your market so they just left them off & maybe use this printing for other similar markets where prices vary (Alaska) or maybe even currency (Canada?).

Open message to KE4EER and others in No. Alabama,

My APRS HF GATE has been running 24 hours/day without interruption or reset since the weekend. After viewing the Heard log and the stations on the screen since that time, I suspect the "mystery" GATE is none other than our favorite Southeast digipeater....Peter, W7LUS, in Northeast GA.

Apparently both W7LUS and KE4EER-5 are located at high altitudes on top of mountains. This, combined with high RF output, is allowing stations to GATE through Peter into Alabama.

To confirm this, KE4EER needs to send a message via VHF to W7LUS to see if he can talk directly to him. If you get no answer, try connecting to

his mailbox or node.

For final confirmation, have Peter disengage his gate temporarily and then try to send out your posit via the GATE. If it doesn't go out HF, then you have found your mystery gate.

Good Luck.

Kevin KD4UYR.

So now, the posit WILL > show up on VHF. Maybe you can even add this to your INITTAPR.TNC file!?
>
> I guess I can add this to APRS code...

MacAPRS transmits everything on both freqs, including WX, ID, BEACON and Posits, when you enter a message you can choose if it is sent over HF, VHF, or both. The program defaults to whichever band it first heard the station to which the message is addressed. Very slick, and will be even better when KISS mode is added, as each message will have a path as direct as possible to the recipient.

> rate, say once or twice an hour, and not in response to the ?APRS?

> message.

REPLY: NO. Intention of BLTNS is to get the word out. It has to be at

least every 15 to 20 minutes to accomodate new stations on a net.

Remember

that APRS was designed for local public service nets. I DO like the

suggestion that someone made to have them die after 2 hours, but again,

on an HF announcement for something like the last Meteor Shower

experiment, that 2 hour limitation would have made it impossible...

OK, how about two different types, one that worked as it does now, but

killed itself in two hours, and another that was broadcasted twice an

hour until manually killed. That sounds pretty good to me.

Could not agree more. There is nothing wrong with the system or the

software. The only problem is the EGOS of some of the operators who need

to Bcn such things as TGIF via wide.gate, gate. Who cares! Possibly we

will need to have the BUDLIST at gates set up to not pass packets from

habitual offenders. Sounds harsh but the traffic passed by the gate is the

responsibility and at the the descertion of the control op.

Just my two cents worth (I have great exposure to all TNC's...)

Thanks for the advice, Mike. I was just using the 1270 as an example. The KAM is a fine box, and I'm not criticising or complaining. My point is that if you are going to dedicate a box to a packet to packet gate, the all-modes are mostly wasted. Is the 9612 capable of this?

396. digital modes on SSB 2m

From: keating@nosc.mil (Roger Keating)
Date: Wed, 27 Sep 1995 08:56:04 -0700
To: ke4htm@hci.net (J Dean - KE4HTM)
Cc: aprssig@tapr.org, WSWSS@aol.com (Western States Weak Signal Society)
Message-ID: <v02120d07ac8f1de77393@[198.253.138.98]>
Rendered body type: text/plain

To ARS KE4HTM,

I'm told your station has broadcast a proposal that 144.180MHz be used for digital packet communications using SSB mode.

The goal of experimenting on the VHF bands with non-FM digital modes is interesting, and perhaps has merit technically, BUT, you ought to check on the current use of these bands (become an expert or consult some) prior to choosing the frequency.

I would have suggested you use 144.295 IF YOU HAVE TO OPERATE IN THE WEAK SIGNAL PORTION OF THE BAND AT ALL. I think this would not be welcome by the people who are already using this sliver of spectrum.

Why not try out this mode in the experimental mode portion of the 2m band?

Packeteers seem to have a poor reputation for respecting band plans, and if this is a genuine representation of what you have proposed, then it confirms and compounds that reputation. I'm sure that does not help anyone.

I urge you to get more information and consult experts and band plan committees before blindly floating public proposals such as this.

If you are trying to be provocative, it isn't appreciated. If you didn't anticipate the effect of this proposal when offered, I urge you to buy flame retardant and carefully consider your reactions to the replies.

I might find using digital modes with VHF SSB interesting, but I do not support the proposal (attributed to you) that I've seen posted on VHF email reflectors.

397. More on HF-VHF gates

From: Jeff Ward <jward@marlin.gulf.net>
Date: Wed, 27 Sep 1995 13:14:24 -0500 (CDT)
To: aprssig@tapr.org
Message-ID: <Pine.BSI.3.90.950927123819.13459A-100000@marlin.gulf.net>
Rendered body type: text/plain

I've been reading with interest the discussion on HF-VHF gates. Here in the Florida panhandle VHF APRS activity is going strong and getting stronger. So strong, in fact, that when one station started gatewaying the HF stuff onto VHF, people started to leave. They simply didn't see the need to, nor did they want to see conversations between guys halfway across the country. Nor did they want to constantly see all those useless bulletins everybody's been talking about. Because of the high VHF traffic volume, competing with the HF packets coming in turned folks off. Now, occasionally a mobile will come through gate-ing, or new folks will come on with their gates running, but they are promptly met with a barrage of courteous requests to turn them off. Sometimes we never see those new stations again, but local activity continues to grow. So now, we are

discouraging the use of HF gateways as we set-up our section-wide ARES/SKYWARN digi network. We were just losing too many folks. So far we've been pretty lucky, and all those stations we've asked to turn off their gates have done so. If (and more likely when) we run across one that won't turn off his gate, we've got contingencies to deal with the problem, at least with all the ARES/SKYWARN affiliated digis.

This is not to say that we don't recognize a potential use for gateways, just that we would probably utilize them on some alternate HF frequency, for our ARES/SKYWARN use only.

APRS is a great program. In some areas of the country it may be advantageous to run HF gates all the time. In others, it may not. There's no reason why anyone should criticize anyone else for their views on how to best apply APRS. But just because a program has a feature built-in, that doesn't mean you HAVE to use it, either.

Just my \$0.02 worth.

I fully agree with this message from Jeff N4TRY, this is why i'm reposting it. We where starting to really grow in this area also, but due to all the HF gates which of course are users that we cannot communicate with anyway they drifted away and lost interest in APRS for local WX usage. Please forgive the repost but i found it that important, specially since all you users figured i knew who the local HF Gate was, if i did i would deal with it you can rest assured.

I do not want to start another argument here (we have enough right now!) but just my PERSONAL two cents worth....

The KAM and KAM+ are fine units and I have one of each here on the desk but I would question the chosing of a KAM over MFJ if it will only be for a dedicated use. I also have a 1274 MFJ and a PK-900 here (many others for VHF also) and have found that the KAM and KAM+ fall a bit short on pulling in the packet signals even with the least bit of QRM or QRN, seems that the internal filtering leaves a little to be desired. If SUPPORT is the question I agree, kind of.... I would chose NEITHER! I think that both MFJ and Kantronics both stink in the customer service deppartment.

Back to results, the PK-900 right next to a KAM+ will pull signals out of the band that the KAM+ cannot. Same rig, same antenna, same everything the only difference is the seconds it takes me to switch the cable and re-adjust the audio for the two units. Some day I will try to set up a Y connector with the correct padding so both can be driven at the same time and have 2 PC's running to see which one prints out more packets.

What this proves is that nothing is perfect, the PK-900 is expensive, the KAM is good but not as good and the MFJ will do the job well for less \$\$ as long as you feel you do not need help from MFJ. Take your time and think it out, either way any of the TNC's will do but you may or may not be 100% satisfied.

Yep 2 types of BLN's would be good as long as the APRS code can handle the added space, I think it might be geting to a maximum now (yes Steve I know MAC does not have this problem hi hi).

The biggest problem will be to have people use it in a smart manner! Some might say to heck with it I am going to place this in whatever mode that will create the most racket! If we have an option it will only be useful if it is used by all.

Absolutely right, and it sounds like your area is doing a good job of
making APRS work for you needs and interests. Here is South Florida,
there is little if any Skywarn activity, and the people that use APRS do
so for different reasons. I've run my gate on most of the time for the
last year or more. In all that time no one has ever complained about the
level of traffic coming thru the gate. Our biggest problem is too many
people running WIDE on VHF. The presence of my and other gates has
attracted people to what would otherwise have been another mostly empty
packet freq in SFL. The real thrust of this discussion isn't whether
gates should go from HF to VHF, but the other way around.

I been working on APRS configurations for my home pc and my laptop - with
and without the port switch to the GPS.

I'm a bit confused about the difference, if any, between saving the config
using Alt S SAVE and File - Save commands. Is there a difference? Should one
be used over another? I've been saving the file as qth.qth and opening APRS
using APRS7/qth.qth. I think I am running ver 7.0 (I'm at work and APRS is
at home).

I like to run with the junk filter ON, map labels feature and beeps OFF.
These settings don't seem to be stored in the config. Are these supposed to
be saved? Am I doing something wrong?

I also notice a 'i' in front of some calls on the map and posit list, like
iWA2AGE. What is happening with this?

Also, when setting up the unproto path, the U command: Do I enter ARPS,WIDE
or just WIDE (or callsign of digi)?

Still learning, using and reading about APRS!!!

Randy
WA2AGE

I disclaim everything.

2) None of the feedback gives me any clear idea whether DOZ mode does anything good... One station said that his system works "better" with DOZ on, but what does that mean?

To make DOZ error free in the background will take some more work, but from the feedback, I don't see that DOZ solved anything.

What follows here are all the comments cut down to size....

From: KSwaggart@aol.com
I was able to use APRS in WIN95 in forground, but not background.
I tried both 16 color and 64 color VGA. Before, with Windows for
Workgroups, I could run it fine in the background if I used 16 color
mode (display setup), but only full screen with 256 colors.

Page 1211

I'm not having much luck with APRS 6.6 and Windoze 95.

1. When APRS is in full screen mode, everything works fine
2. When APRS is running in a window (alt-Enter), aprs is apparently running. All the letter and number keys work fine, but not the cursor pad or PgUp/PgDn. The display is a perfect 640x350 dot box on my 1024x768 screen.
3. When APRS is running in a window, the priority is apparently low enough that the usual beeps are sometimes extended to extra long tones. This seems to be controlled by whether the APRS window is the "active" (mouse inside) window.
4. The Windoze 95 "System Monitor" shows that APRS probably has a "spin loop" that consumes CPU cycles waiting for input. Kernel processor usage runs 100% with APRS active.
5. Shoving APRS from full screen to the "Task Bar" (alt-Esc) results in APRS going comatose. Input is apparently buffered in the TNC as switching to the foreground results in a buffer flush.

From: Don Smith <kd4ksv@hiwaay.net>
Been using it for about 4 months with no problems.
-----< Don KD4KSV >-----

From: jeff.brenton@espi.com
Bob, APRS works fine in the background under Windows and OS/2, if you are willing to accept certain restrictions. If you will accept 16 or 64 color modes, APRS can run in the background. If no task makes use of the high-resolution VGA (256 color), APRS will run when in the background. However, most multimedia products insist upon 256 or even 32,767 color modes be enabled. Under OS/2, since the Presentation Manager (aka the "desktop") is always running, and is set to the high resolution, APRS stops when in background, unless you limit it to CGA graphics (looks ugly!). In Windows 256 color mode, if you run two DOS tasks (APRS being one of them), APRS will run when the second DOS task is running full screen in the foreground, but it will stop if you try to run it in a window, with Program Manager or some other GUI program running. This has been my experience - the last item (APRS running in background with another DOS task in the foreground) actually surprised me; I hadn't tried just switching between the DOS tasks during the first test.

From: Dan Reilly <72076.2270@dub-gw-16.compuserve.com>
Bob, I've never had any trouble running any version of APRS in the background with either Windows 3.1, 3.11 or 95. I can't understand all the trouble others are having. Dan W4NMMK

From: jeff.brenton@espi.com
The problem is that, once you select the video mode, until you select a different one, Windows and OS/2 will consider it in conflict, and not doing the updates wouldn't help. If you can sense the switch to background and go to a text or lower-res video mode, that would do it, and come back to normal when in the foreground.
[APR COMMENT: That's what DOZ was supposed to do]

From: Bob Baltz <bob.baltz@ustc.vlsi.COM>
I ran 73b in the background of WFW3.1 at 50% opening it via a PIF. It worked fine as long as you sent it to the background while in the map mode. It returned in the show via (D page) not a problem. It sent and rcvd packets fine. The only noticeable difference was that at 50% priority the audio signals for new pos etc were longer than normal. I did not use DOZ. This basically lets APRS do its thing as you go off and use the machine for other things. It also ran in a <100% window but REAL SLOW.

From: BAIRDBAIRD@aol.com
Am running APRS 73B in windows in a 50% window. Works fine. Equipment is old 386 /8meg ram/ 640x480x16 colors vga/ refurb IBM color monitor. Runs slow if trying to use another graphics app. Also run APRS on 486/ 66dx-16meg ram 1024x780vga runs acceptable speed. Have been doing that for past year or so.

From: Jack Anderson <n4uls@ix.netcom.com>
The default PIF should work fine, provided you have background execution enabled, and you are running APRS in a full screen and not a window. APRS should also work in a window, but it might be slower and there may be problems with the graphics. You can play with the font setting to get different window sizes.

From: Jack Anderson <n4uls@ix.netcom.com>
Others may be able to answer this better. I have run it under windows before in a full screen session and noticed no problems with the program in the background or foreground. Of course, it does not release timeslices, so the effect of having it running in the background is

quite noticable on a 386. It flies on a 486 though. I have not tried 73b or the DOZE mode.

>>(VHF)

>Ken Rogers also wrote:

>Is LA/Orange County really that sparse for APRS?

The major problem facing lack of activity in SoCA is the ability to place all APRS activity on a common channel, i.e., 145.790 MHZ.... At the present time, some individuals are operating APRS from their home locations, as a small group of HAMS who want to use 145.785 as their simplex, autopatch, repeater channel has delayed the development of any WIDE area stations.

The Southern CA Digital Communications Council Board of Directors will meet this Saturday, September 30, 1996 at DANA School on Aviation Blvd. A packet workshop will be held from 11:00 AM until about 1:00 PM following the TRW Swapmeet, at the same location.

- 1) This subject should be discussed during the meeting and I would encourage any individual who supports the development of APRS in SoCA to attend and make your desires known to the Board Members.
- 2) Your participation in the Council would also be helpful. Join the group and make sure that everything possible is done to designate an APRS Frequency, preferably 145.790 MHZ.
- 3) Subscribe to the scdcc mailing list and send some email to the other members and the Board of Directors, most of whom also subscribe. (EMAIL me direct for details on joining the mailing list.)
- 4) Politic TASMA, 220SMA and SCRRBA and exert some influence on their Board of Directors to get some action.

I would like to hear from others who have similiar problems, recommended solutions, suggestions, etc. Please email me direct rather than involving everyone else in a local issue.

Rendered body type: text/plain

I just heard that Oct 21 is the target date that the ARRL is encouraging all section emergency coordinators to schedule their annual Simulated EMergency Tests. Maybe it is time to introduce APRS to the SET. My uninformed knowledge of SET's is that each section sort of does its own thing with each EC sort of developing an emergency scenario for his county...

There are several opportunities:

- 1) Take APRS to your EOC to show what it looks like
- 2) Activate APRS mobiles for some simulated emergency vehicles
- 3) Get all your local APRS stations on the air...
- 4) Depending on activity, keep most packets local except for valid simulated traffic for intra-sectional traffic
- 5) On HF simulate traffic of national significance (IE Hurricanes)

Work with the existing EC in your area to integrate yourself into their planned exercise. Be careful NOT to overload the APRS NET with fires in every trash can. Yes each one of us could put 50 emergency objects on our screens and beacon them far and wide, but what we would end up demonstrating is gridlock and stupidity, hi hi...

In contrast to all the arguing about who is using his APRS station "properly" and who is "not", here is an opportunity to at least try to do something useful, hi hi...

Bill- seems as if I remember that they are on a weird frequency. There's
an internet web page that discusses activity in CA (North, I think). If you
don't know that page, I'll try to check it and email you the freq. Maybe
someone else here knows it and can get it to you quicker.

Dunno if it has anything to do with anything, Kev- but I haven't seen Peter's
station on VHF in Atlanta (and I usually do) in over 2 weeks! Could he
still be gating?

I think there is a station gating in Athens, GA (KN4WK ?) and I also think
Jasper GA (KB4IZF) also does it. Not being too familiar with the Gate
operation, I don't know if this info is worthwhile but maybe it will help.

I think a lot of people gate without realizing the impact on other users.

Bill,
There are only a few of us in SoCal on HF. I usually only come on
during weekends/holidays on HF. Currently, VHF is sparse and scattered
with a couple of us on 146.745 (-600) duplex repeater. Some movement
has surfaced to put APRS on 145.65 but I haven't heard any more on that
and 145.79 is only 5kHz above a net freq that may keep that from being
chosen in LA/Orange county, regardless of what San Diego has decided.

Bob... It would be nice to save "callsigns off" in the config so that when operating standalone you only get the posit dots and don't clutter the map with your callsign.

The 9612 is cabable, if you want 9600 on the second port.

For point to point VHF 1200 baud, then your setup should function OK

That would make a nice "2nd generation gateway" - 1200 bps 10 meters to 9600 bps
2 meters...

Thx to those who replied. The U.S. mainland version has prices listed. RS made a "special" catalog for English readers outside the mainland THAT HAS NO PRICES LISTED so they can mark up the price for overseas shipment. I'm still in shock. Next time I'm on the mainland I'll pick up the real catalogue. That way I can see how much more RS is ripping me off for living in paradise. Oh well, back to the sun and beach. I hear a tan calling me. Aloha, Dave.

Quite true. I purchased a used KAM several years ago as my first TNC. It wasn't until I bought a KPC-3 a year later that things started to make sense. The KPC-3 comes with some nice introduction to packet documentation. After reading all of the KPC-3 docs I could start making sense of the KAM docs. Part of the problem with the KAM docs is that Kantronics tried to write one manual to cover the operations of 4 or 5 TNCs (KAM, KPC-2, KPC-4, KPC2400, ?).

Our thanks to Jess for his contribution!

But now we need another volunteer to serve as an ANSWER man for subscribe issues. Here is Jess's retirement letter, hi hi...

From: Jess Girard <girard@panix.com>

As you know I undertook the responsibility of helping those who have subscribe/unsubscribe issues, and I have a file I call aprssig.txt which explains how to perform those functions correctly. I typically send that file to everyone who erroneously sends a subscribe or unsubscribe request to the the reflector rather than to the tapr robot.

I'd like to unsubscribe myself for a while. May I send that file to you? Or would you prefer I send a similar message to APRSSIG and see if someone wants to be the custodian? I just can't seem to make the free time lately...sorry.

Thanks Jess; Anyone else?

425. Re: [APRSSIG:3553] Unsubscribing help

Date: Thu, 28 Sep 1995 17:19:57 -0400
To: aprssig@tapr.org
Message-ID: <199509282119.RAA32427@tequesta.gate.net>
Rendered body type: text/plain

I have the same problem as Warren does with UNSUBSCRIBE! I started with limited Internet and now have a different account on a PPP system. I have forwarded all of my mail from one to the other account and get 2!!! of each APRSSIG message since I cannot unsubscribe but got to have the forwarding so I do not miss any mail that goes to the old address for a while.

Help PLEASE for both Warren and I.

427. BULLETIN decay

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 28 Sep 1995 20:54:52 -0400 (EDT)
To: aprssig@tapr.org
Cc: Prof Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Message-ID: <Pine.SUN.3.91.950928204548.362D-100000@greatlakes>
Rendered body type: text/plain

I made an easy fix to bulletins...

1) All normal bulletins (BLN0 to BLN9) will decay forever. This means that there will be one at 16 secs, 32, 1min, 2min, 4min, 8min, 16 min, 30min, 1hour, 2hours, 4hours, 8hours, etc.... This is just about the same thing as killing it after 2 hours...

2) There is another bulletin structure that will retain the current way of doing business, and that is to decay down to 15 minutes and stay at that rate. No need to publish this to all the "LIDS" on frequency, hi hi It will be in the DOCS...

428. Baycom with APRS

429. GPS45 and Tiny-2

From: gphowell@soulcage.inmind.com (Geep Howell)
Date: Thu, 28 Sep 95 21:41:06 EDT
To: aprssig@tapr.org
Message-ID: <199509290202.WAA17420@crucible.inmind.com>
Rendered body type: text/plain

This may be overkill since I sent a private message to Gwynn at PacCom, but here goes. Anyone out there that can offer any help on making the Garmin GPS45 work with the Tiny-2's GPS mode. I think I have all the parameters right, and have tried both GP words to no avail. I have been able to make the TNC recognize the GPS in the UIMODE mode by using the 1k/10k resistor network that Bob suggests, but I don't want a continuous data stream. Trying to get the setup running for a 10 mile foot race (Yes, K4GV0, the Va Tenmiler lives...) on Saturday -- guess I should have started a bit earlier, huh. Thanks in advance, Geep WA4RTS in Lynchburg VA

BTW Bob, by tomorrow evening there should be a WIDE digi at about 2800 feet on 145.79 and I am told that several others are going up in the area, so perhaps you will be able to see us before long. The site favors the east, so its possible that we will see any activity in the Richmond, VA area. We need another TNC to get the RELAY and WIDE aliases in X1J code -- WA4BWB bought a PK12 which according to K4ABT does not support X1J. Live and learn, 73 all

430. Garmin 45 and Tiny-2

From: gphowell@soulcage.inmind.com (Geep Howell)
Date: Thu, 28 Sep 95 21:51:05 EDT
To: aprssig@tapr.org
Message-ID: <199509290208.WAA17479@crucible.inmind.com>
Rendered body type: text/plain

This may be overkill since I have sent a private message to Gwynn at PacCom, but here goes (time is running out) Anyone know the trick to getting the GPS-45 to work in GPS mode with the Tiny 2. I have gotten the TNC to recognize the GPS output using the two resistor trick but only in UIMODE and I don't want data all the time. Have tried both GP words and even reset the serial parameters to 7 bits instead of 8, all to no avail. I think all the parameters are OK but it never seems to get a work in the LTEXT spot to trigger the beacon function. Help! I have a ten mile foot race coming up on Saturday, and was planning on using the combination for a standalone tracker. That's what I get for waiting to the last minute.

To WB4APR -- a WIDE digi on Tobacco Row Mountain should be in place on .79 by this weekend. As soon as we get and X1J compatible tnc, it will be WIDE/RELAY, but the PK12 that WA4BWB bought to use doesn't support the code, according to K4ABT who was going to do a prom for us. Should hear well to the east from Lynchburg, perhaps even pick up some of those richmond folks.

73, Geep WA4RTS (gphowell@inmind.com)

431. Poor KAM documentation.

From: Turnstone@aol.com
Date: Fri, 29 Sep 1995 00:00:45 -0400

Message-ID: <950929000043_112242139@mail06.mail.aol.com>
Rendered body type: text/plain

Tom Mosher, KC7AGK in Salem, OR says:

Amen to Jim Lynch regarding how awful the manual that comes with the Kam Plus is. It's basically unusable as a tool for learning how to operate the digital modes. The manual consists of just descriptions of the commands in alphabetical order, with a short and thin description of each of the operating modes. No instruction at all on the nuances of how to set up the configurable parameters. I love how it operates, though.

436. Subscribe/Unsubscribe Problems

From: Jess Girard <girard@panix.com>
Date: Fri, 29 Sep 1995 10:22:19 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950929101900.22100B-100000@panix.com>
Rendered body type: text/plain

Hi All:

Here's the file I send to anyone with subscribe/unsubscribe problems. It's simple, except to those who don't know how to do it.

To subscribe to the APRS Sig (aprssig):

Send an email message to listserv@tapr.org, TAPR's robot mail distributor:

The single line of text: subscribe aprssig

That's all! The listserver robot will send to your email address all email messages addressed to `aprssig@tapr.org`.

*~**~***~****~*****~******~*****~****~***~**~*~
To un-subscribe to the APRS Sig ([aprssig](#)):

Send an email message to listserv@tapr.org

The single line of text: signoff aprssig

*==**==***==****==*****==******==*****==****==***==**==*

Caveats:

When you subscribe, you'll receive an email from the listserver explaining some extra options you may use. Don't delete that file!

No one else can subscribe or un-subscribe you. The sender's email address is used by the robot to turn on or turn off the forwarding to you.

437. Logging question...

From: jan@archimedes.vislabs.navy.mil (Jan A. Barglowski)
Date: Fri, 29 Sep 1995 07:36:52 -0700
To: aprssig@tapr.org
Message-ID: <v01520d01ac9152bdfa19@[129.131.31.10]>
Rendered body type: text/plain

This is driving me nuts, as I'm testing a WIDE digi and a mobile at the same time, too :-)

I can't seem to log any of the track history from my mobile. I clear the screen, go drive around for awhile, then when I return the screen shows where I've been. I then do a FILE-SAVE, and note the HST file, too. But when I go to replay, either the BK or the HST file, the route is not retraced! From the docs I gather that the BK file saves the "who" and the HST saves the "where".

Another possible related thing is the Control-Logs command. I couldn't find anything in the docs regarding this. When I did this I noticed that the "log" in the control bar across the bottom of the screen was lower-case, and the invocation of the C-L command turned it to uppercase. Is this a logging enable/disable switch? I didn't have the time to try the drive again after turning it uppercase...

I also had my station setup as a WIDE, if that matters.

Thanks for any help!

438. TNC setup

From: CCVFS.DRAWING@capital.ge.com
Date: Fri, 29 Sep 1995 13:35:32 -0400
To: "aprssig(a)tapr.org" <aprssig@tapr.org>
Message-ID: <0013800001195135000002*@MHS>
Rendered body type: text/plain

Can anyone tell me, is there a way to change the initial set up strings (echo n, heardln n, etc.) that is sent to the tnc in MacAPRS? (Not running 2.0 yet and if this has changed please let me know) I do know how to add additional commands but not change the defaults.

The reason I ask is that my tnc (Tiny 2) does not recognize all the commands that are 'hard coded'. What I need to do sometimes is to reinitialize the tnc once or twice via the program. This is not a major problem but can be annoying sometimes.

While I'm asking questions, is the window to directly address the tnc going to be reactivated in future versions? This is a feature that I have used many times in the IBM version. For instance my PBB5 sysop forwards my mail directly to my mailbox. To view it I need to quit MacAPRS read it via my regular terminal program then rerun MacAPRS. If it's not going to be active soon, does anyone know how I can reassign the serial port back and forth between programs? This would also solve the problem.

Thanks,
Dana - N10FZ@W1CDM.CA

```

APR REPLY: When in UCASE, a file will AUTOMATICALLY be saved when 200 HST points have been accumulated. BUT it does NOT automatically save on QUITTING APRS unless you give a name for the BACKUP file OTHER THAN BACKUP.

APRS WARNING: If you are running an AEA TNC, then IT DOES NOT monitor

packes that it digipeats! Crazy if you ask me, but thats the way they set it up. There is a command for turning MONITORING of your own DIGIPEATS on, maybe it is MRPT on?

FINALLY, on a MOBILE APRS PC, there is a difference between each plot on the mobile map, and each time the position is transmitted. The ALT-SETUP-POSRATE command allows you to set both rates...

Good luck. Let us know what you find out..

445. KANTRONICS

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 29 Sep 1995 15:35:22 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950929153216.9639K-100000@greatlakes>
Rendered body type: text/plain

Since Kantronics TNC's use the BEACON EVERY X where X is in MINUTES and all other TNC's assume X is in 10's of seconds, the KANTRONICS user has to enter 20 every time he QUITs APRS if he wants his beacon to go out every 20 minutes instead of the default 120 That APRS uses.

A better way, is to simply enter the command in your APRS\SYSTEM\RESTORE.TNC file as follows:

BEACON EVERY 20

If you have a KAM, then APRS does this, since it knows you are using a KAM... But for other KANTRONICS TNC's, this is advisable..

446. GPS-45 & Handi Packet

Rendered body type: text/plain

Success !!! I finally got my Paccomm HSP switcher to work with my GPS-45. All I had to do is open up the HSP jacket expose the circuit board and solder a resistor from pin 7 of the DB-9 connector to the center pin (collector) of the SOT-23 transistor marked TR4.

Why did I have to do this you ask, well all GPS's are not created equal, it seems that the voltage levels on the GPS data line vary, the GPS-45 wasn't providing enough voltage for the transistor to switch when APRS would do it's NMEA request. Also in line are two 1N914 diodes dropping the voltage down about 1.4 volts to boot. I didn't remove the diodes because they do serve a purpose, so the beefier voltage from pin 7 did nicely.

Oh yeah don't forget to set your TNC to 4800 baud (terminal), duuuhhh, I did.

PS- Bob I didn't need that pin swap adapter. Thanks for all the help.

Happy APRSin

Kantronics TNC's focus on the user acquiring software written to
support their host mode. This allows the Kam to achieve most of it's
flexibility. With AEA, the modem pairs are designed by their
engineers. This is why I am replacing my DSP-2232 with a Kam Plus and
a Timewave DSP-59. I get better front end filtering and all the
flexibility I need.

Another 2 cents worth..

Its posted on ARN BBS 410-280-2503. I cannot seem to get my FTP server
to accept my Kermit or Zmodem uploads anymore... So if someone gets it
off the BBS and posts it on TAPR, thanks,. Remember, 73b was just a BETA,

this is about the same thing, but with these additions:

- * OPS-DIGI-ALTPATH allows you to have an occasional ALT-PATH for your routine beacons. You may set a percentage.
- * All BEEPS are suppressed in F-10 DOZ mode to aid in background ops
- * CHANGED DEFAULT BAUDRATE from 9600 to 4800 since all GPS guys are running at the NMEA standard of 4800. WATCH OUT FOR THIS WHEN U UPGRADE!
- * Houses are SMALLER
- * New BULLETINS now continue to decay. Meaning, that after 2 hours, they are pretty scarce. There is a way to make bulletins last at the 20 min rate though, for the occasional LONG LASTING bulletin...
- * CONFIG now saves DR, JUNK, DUAL, and GATEfilter...
- * No other changes to DOZ mode, because no feedback indicated it had any value.

See the NEWNOTES.txt for details....

Good Luck. You may be able to re-use your GCONFIG file if you add X,0,-1,0,0,0 as the last entry before the DIGI PATHS and rename it to CFG73C.APR..... The digipaths begin with the * * * if you dont have any already saved...
Good luck...

Hello Group: Are the 100k USGS maps (that have been recently described as being applied to APRS) topomaps or street/highway maps ? Thanks, Jim K6OYY

Bob- please cover how to get these files from the internet and what to do when the filenames are too long for the PC to handle and your ftp program won't allow you to change them before downloading them. ie: file extensions more than 3 chars.

And yes, Keith, et al mac, I am sure the mac can probably handle this with no problem, but I use a PC. :)

/Ralph

2. SIG posits

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 1 Oct 1995 09:32:35 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.951001092609.16411B-100000@greatlakes>
Rendered body type: text/plain

Now that keith has a pretty full platter of things to do, is there someone out there that would volunteer to make us a BACKUP file of all stations on this SIG? I think this would be very valuable. If you wanted to check out activity in timbuktoo, you could just load this file, SEE where all SIG members are in that area, and then KNOW who to address in the Timbuktoo area...

All we need is the nearest degree/minute of location, no reason to bother with the hundreths. I believe most everyone sent their locations to Keith some time ago, but we need a volunteer to edit the data in to the BACKUP file format. DONT SEND POSITS now, until we get the volunteer.

3. Catalog for Garmin 45 Supplies Please

6. MacAPRS on HF

From: sp35@cornell.edu (Steven Powell)
Date: Mon, 2 Oct 1995 09:54:31 +0000
To: aprssig@tapr.org
Message-ID: <v02120000ac955abdefe8@[128.84.224.158]>
Rendered body type: text/plain

I have some pretty basic questions regarding HF (10.151 MHz) operation using MacAPRS. This is the first time I have used packet on HF, and I have very limited regular VHF packet experience, so bare with me it these questions seem naive. I am located in a quiet section of upstate New York where there is no VHF APRS activity (yet), so all of my operations are limited to HF.

First, let me thank Bob and Keith for their efforts on both programs. I had no problems installing and running MacAPRS 2.0 on my ageing MacII . It was fun watching the US map fill up with stations, and hopefully I popped up on some other peoples maps. I have read (and re-read) Keith's MacAPRS documentation and Bob's documentation on operation, digis, and HF, yet here are the questions:

1. How do I tell MacAPRS that I am on HF versus VHF? Bob's "HF.txt" document says that the PC program has a HF configuration that changes the default alias from RELAY to ECHO. Is there a way to do this in MacAPRS?

2. How can I tell what stations I hear direct? Are all stations in the "Station List" window stations that I can hear directly? When I look at the "History" window is there a way to determine what stations I can hear directly?

3. Assuming that I can be heard directly by several others on HF, what is the correct routing to specify for routine HF operations, so that I appear on the maps of other HF stations? Is it simply to specify None, that is, no digipeating? Is digipeating really only relevant to VHF operations? If I have a weak HF signal what routing should I specify to maximize my HF range?

4. I have noted that several stations on HF were using the following routing: "W7LUS, gate, wide". Is this being used because they wish to digipeat through W7LUS who presumably has a better HF signal? Does the originating station desire to go through a HF to VHF gateway and then through a wide area VHF digipeater? Is this routing used with the intention of reaching APRS users only on VHF, or VHF and HF?

John:

I've been working on making some 100k APRS maps of the Ridgecrest, CA (yea, we've had some earthquakes lately :-) area. I'm using MAPFIX15.EXE to make the maps from files converted by the CONV100C program.

On one chunk of the map, I create the map within MAPFIX15, remove all the single point features (the "C" command doesn't do anything :-() , then I run it thru the DEFRAGB program. But one file causes the DEFRAGB program to crash in one of two ways: It can't find the SCRATCH1.TMP file to copy; or it gets an "END OF INPUT FILE" error. Have you had these problems, and do you know what causes them?

Good luck on your "howto to APRS maps" paper. I'll be willing to proof it for you if you'd like...

Well, I'm using an AEA PCB-88, and researching the manual tells me the MDIGI command is the one which allows you to monitor your digipeated packets. I checked, and it was set on (allowing to monitor). But when I set the home station's alias back to RELAY, I was able to save the track history file. I will attempt to duplicate this in the next few days. BTW, the mobile is unproto to APRS via WIDE.

Subj: SIG Posits

Bob: re your request for someone to manage the SIG Posits database and
BACKUP file. I'll be happy to take a crack at it. I manage a number of
databases here in Dallas now, both for my company, TI, and for the Dallas
RACES organization. I've got a good set of various utilities and think I
could probably handle this without too much trouble. Don't know off hand the
format of the BACKUP file - maybe it is in the APRS documentation, but it is
at home and I'm at work now.

If you could either tell me the format of the file you need, or point me in
the right direction to find it, and tell me how to find the existing Posits
data, I'll have a try at it. Let me know if you want me to go with this.

Thanks Claude Head

> document says that the PC program has a HF configuration that changes the
> default alias from RELAY to ECHO. Is there a way to do this in MacAPRS?

The two programs are NOT at all the same, as far as configuration etc goes. If you are on HF and WANT to be different the MAIN thing to do is to make sure your position report rate is SLOW. But MacAPRS defaults to quite slow anyway, so this isn't problem. If you want your PATH different, set it different..

> 2. How can I tell what stations I hear direct? Are all stations in the
> "Station List" window stations that I can hear directly? When I look at
> the "History" window is there a way to determine what stations I can hear
> directly?

When you look in the HISTORY windows, you can tell how that packet was

heard by which item has the ASTERISK on it..

```
WU2Z*>GATE>WIDE>APRSM:....      was heard direct
WU2Z>GATE>WIDE*>APRSM:....      was heard from the WIDE
```

And in some cases, you will see one packet, then the other, i.e.

```
WU2Z*>WIDE>WIDE>APRSM:....
WU2Z>WIDE*>WIDE>APRSM:...
WU2Z>WIDE>WIDE*>APRSM:....
```

>From this you can tell that you are hearing TWO DIFFERENT wides, and the station directly...

I have considered creating a display of some-sorts showing this type of stuff, but had not put a lot of thought into it, and also do not know how useful it would be..

> 3. Assuming that I can be heard directly by several others on HF, what is

> on the maps of other HF stations? Is it simply to specify None, that is,
> no digipeating? Is digipeating really only relevant to VHF operations? If
> I have a weak HF signal what routing should I specify to maximize my HF
> range?

If you are on a channel (HF or VHF, doesn't matter) and ONLY want to be heard DIRECT, set the PATH to NONE... Then you will not be repeated anyplace..

> 4. I have noted that several stations on HF were using the following
> routing: "W7LUS, gate, wide". Is this being used because they wish to

> intention of reaching APRS users only on VHF, or VHF and HF?

W7LUS has a GREAT HF signal, and can be heard by lots of us..

If you have a GOOD gateway or wide and want to use it SPECIFICALLY, specify it by CALL SIGN, not by ALIAS (wide and gate are aliases)

Strangely enough, we in Northern California use the 145.010 frequency for APRS. (Yes, different band plans for North and South in the Golden State... :-)

Just out of curiosity, I'll try listening on a number of the other packet channels, and see what I can see. Since folks can add the Lat/Lon data to almost any device (high-level digi, PBBS, etc.), maybe I'll find a bunch of stuff there. (Then again, probably not, since most of the APRS is restricted to 5.01, I doubt many folks on other frequencies have cared.)

Just my two cents...it's not just on 4.79 *everywhere*, so folks may want to look around on other frequencies, just for fun.

I am located north of San Diego just below Camp Pendleton in Southern Calif. As far as my maps show I am the northern most VHF station on the air San Diego area.

Is there anyone in the southern L.A. area that would like to try to link these regions? Is there any interest in linking them together?

I have another complete station (including a small beam) that could be dedicated to the north. The only thing I don't have is a dual port tnc. Is it possible to somehow link a KPC3 and a Tiny 2 via hardware or software? I haven't looked into this yet as I just had this idea and I'm at work and don't have my MacAPRS manual with me.

If there are any interested parties please send me a message at:
ccvfs.drawing@capital.ge.com or N10FZ@W1CDM.#SOCAL.CA.USA.NA

Strangely enough, we in Northern California use the 145.010 frequency for APRS. (Yes, different band plans for North and South in the Golden State... :-)

Just out of curiosity, I'll try listening on a number of the other packet channels, and see what I can see. Since folks can add the Lat/Lon data to almost any device (high-level digi, PBBS, etc.), maybe I'll find a bunch of stuff there. (Then again, probably not, since most of the APRS is restricted to 5.01, I doubt many folks on other frequencies have cared.)

Just my two cents...it's not just on 4.79 *everywhere*, so folks may want to look around on other frequencies, just for fun.

regards,

David K. Z. Harris

Hi James,
I went to E and B boating when I was in Atlanta a couple of weeks ago.

Give 1-800-Boating a call and ask for the Atlanta Address, or check the phone book. Make sure you call before going there. Although we could see it from the interstate, it took us 30min to get there.

cheers...mike

Hi...

A friend and I have been trying since Friday evening to get our APRS programs and stations working properly. We are at the point where I receive his beacon which comparing it to the format in the docs looks correct. But I do not get a display of the station on my map. Also, from his position he can hear many other stations from New Jersey but does not get a display on his screen. We have tried various combinations of RELAY, WIDE, WIDE,WIDE, WIDE,RELAY, SPK,WIDE, SPK,WX3A, SPK,RELAY AND WM3L (SPK being a local packet digi in the area), and have had no luck with any. Also there is nothing in the Heard, Latest or All Beacons lists at either station.

My friend Ray, WX3A is using an AEA-232 TNC, and I have a PacComm TNC-220. BTW...as far as we can tell, we are the first and only operators trying this in our area...we hope to get more!

Hopefully, this is a start on the resolution of our problem but being so new at it, I'm not sure exactly what questions to ask or what info may be needed for a complete solution. If you can help us, and need more info please e-mail me.

Thank You.....Bernie, WM3L berlyn@epix.net

Phil, Don't you have the APRS program yet, the GPS.TXT file is in the APRS
program directory under the README sub-directory.

Better yet, in case you don't have the program, here it is attached to this
peace of mail for you, just open it.

Hope this really helps.

To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.951002232616.4070A-100000@greatlakes>
Rendered body type: text/plain

Got a letter tonight from W5SYT in Austin TX who has a GPS and APRS. He says they have an active WX network (not APRS) even including terminals at the local TV station. But there is NO APRS activity in Austin. He was looking for anyone that could help him get their attention and start a network.

It will be nice when we get the SIG map finished so we can see who is near Austin on this SIG...

APR REPLY: I dont know of a way to do this without a dual port TNC, or someone writing some KISS code to do it between two TNC.s But it is a good project for those areas on other frequencies...

32. PacComm TNC for DSP-93

To: aprssig@tapr.org
Message-ID: <7166@paccomm.com>
Rendered body type: text/plain

Ron, W5RKN inquired about the connection from the TNC to the DSP board serial port. Based on his observations, the product has been changed as follows: A short wire harness will extend from the bottom of the TNC terminated in a low-profile 16 pin plug. If it is desired to make use of the TNC's DSP load function, the 145406 IC is removed (and stored) and the 16 pin header is plugged into the 145406 socket.

This should work for all versions/revisions of the DSP-93.

At 4 AM CST, 3 Oct, 1995, a Hurricane Watch has been posted along the Central Gulf Coast from Morgan City Louisiana to just west of Pensacola, Florida.

APRS offers a great opportunity to track weather conditions along the coast. The National Hurricane Center will be requesting WX conditions in the effected area as the storm moves closer to the CONUS.

APRS weather stations are requested to GATE valid weather observations into the 30 M net along the Gulf Coast region....to be useful to the NHC, WX obs MUST include barometric pressure, in millibars, wind direction, speed, and gusts.

Just a quick note on the filenames issue:

When I grab a file, say, AU2.RDF03.opt.gz, I issue the following set of commands

```
bin                <sets the transfer mode to binary for the GZ files...>
get AU2.RDF03.opt.gz au2rdf03.gz      <gets the appropriate file and
                                      renames it within the PC convention>
```

If you have netscape, do a netsearch for GZIP or COMPRESSION and PC and you'll find the appropriate file... GZIP for the PC seems to handle a lot of compression formats and is a very useful utility.

I'll try to post BLOCK.BAS later today. It's pretty straightforward and works well. Thanks to all who shipped me code. It takes a file that's appropriately named and shifts it an appropriate .DLG extension when done. If time permits between real work and school (1 class today) I'll integrate it into conv100x.bas and you'll have a 1-step process for getting from the compressed file to .GRF files. if I have time.

I pulled this off of packet:

>From : AC6JA @ KA6EYH.#NOCAL.CA.USA.NOAM
To : ALL @ ALLUS
Date : 950928/1356
Subject : APRS HSP Y-cable

Hi there. Name is Mike and I'm in Foster City, CA. This message is for owners of the Paccomm APRS Y-cable HSP switch would have not been able to get it to work. First off, Paccomm has made a change to their HSP cable which included an additional wire. The Y-cable needs voltage at pin 6 of the DB-9 connector which is the DSR line. Some computers, especially laptops, conserve their power by not using or insufficiently powering the DSR line. This is why Paccomm has installed an additional wire in the Y-cable. This wire connects together both the DSR lines of both the computer and the TNC. The problem with using the Y-cable with the HandiPacket is that there is nothing connected to the DSR Pin 6 in the TNC. Paccomm is working on a recommended wiring change to get power to the DSR line Pin 6 of the TNC. I have been able to use the Y-cable with my Kantronics KPC-3, but you need

to perform a slight modification to the TNC. First, you need to cut the trace between the pads of J10. This is explained on page 96 of the KPC-3 manual. Cutting this trace separates the DSR from the DTR line. The DTR line gets toggled from the computer APRS program to switch the Y-cable from the TNC to the GPS for a second or so to update position data from the GPS. Second, you need to install a 4.7Kohm resistor at R-48. This will cause the KPC-3 to automatically pull the DSR pin active whenever the TNC is turned on. This is explained on page 95 of the KPC-3 manual. Lastly, you might need to cut pin 6 either at the computer end or the TNC end, whichever pin you're not using to power the Y-cable. This should only be done if you are experiencing a conflict with both DSR's connected together. Hope this information is helpful to some of you who have been pulling their hair out trying to get it to work. It's not plug-n-play folks! Finally, Kantronics has now come out with their own HSP cable. No adapters needed. The cable plugs right into the TNC, other cable to computer, and open ended wire goes to the GPS. Haven't tried it yet, but at least now I have a head start in getting it to work if I need to. Anyways, good luck, and hope to "see" you on APRS!

I was recently made aware of the following advice about APRS operations in South Florida. The message covers an excellent explanation of how digipeaters and UNPROTO paths work, but at the end draws some incorrect conclusions and wrongfully encourages everyone to be a WIDE! First, my comments and then you can read most of the text yourself..

FACT: Every WIDE that digipeats a packet cuts the channel capacity 50%.
FACT: Every DIGI in a via path cuts channel capacity by 50%.
FACT: When you send a packet via X,Y,Z presumably you only hear the packet digipeated by X, so the 50% reduction in channel capacity is spread out to three areas and only 4 packets are generated along the entire distance.

If you have 3 local WIDES in an area and stations use W,W,W, there will

be 22 packets generated AND THEY ARE HEARD NOT ONLY IN THE LOCAL AREA, but also OUT 3 WIDES IN ALL DIRECTIONS. This exponential growth in QRM has cut channel capacity by TWENTY TWO. Or only 4% of the original channel capacity is available for others.

APRS RULES: To minimize QRM while maximizing range:

- 1) WIDES must have EXCELLENT VHF COVERAGE and be WIDELY separated. *PERIOD*
- 2) Users may cover beyond their area easily with WIDE,WIDE,XXXX,etc
- 2) Users should not use WIDE,WIDE,WIDE addressing under MOST circumstances!

COROLLARY: If you want to increase the range of mobiles:

- 1) WIDES MUST have EXCELLENT VHF COVERAGE AND BE WIDELY SEPARATED. *PERIOD*
- 2) All WIDE digipeaters should also have the alias of RELAY
- 3) Home stations should always be RELAY
- 4) Mobiles should use the path of RELAY,WIDE
- 5) Weak mobiles out of range of a WIDE, may use RELAY,WIDE,WIDE

It doesn't take a rocket scientist to understand that if you are hearing each packet 10 to 20 times, that your network is NOT working for the other 99% of the users on the channel!

Here is the message. The first part is sensible. The last paragraphs make it clear that there is a fundamental misunderstanding in channel throughput.

```

APR COMMENT: This overlooks the fact that SOME PACKETS WILL NEVER get past TWO WIDES. Both WIDE's will ALWAYS repeat the packet at the same time, meaning NO FURTHER WIDES will EVER hear the packet without collision.

```

>
CONCLUSION: What the above individual has overlooked is that CERTAIN
PACKETS WILL NEVER GET THROUGH when there are more than one WIDE that
hears a packet. If there are 2 WIDES between a user and a THIRD distant
WIDE, then that 3rd WIDE WILL NEVER HEAR THAT USER, no matter how many
WIDES he puts in his path. This is because, both of the first WIDES will
always COLLIDE at the 3rd WIDE so that it ALWAYS hears mush.

Hello de Robert, N7LUE !

If you have been trying to get in touch with me about RS-232 option boards for doppler units, well, I've been out of the country on business and I had no access to the Internet. The good news is I'm back for a while and eager to answer questions or provide assistance. Those of you who managed to find me via snail mail, let me know how you like your kit!

Glad to be back on the list!
Robert, N7LUE

What's his in-process date? I spend quite a bit of time over there, and have some good maps of the Coperas Cove area, and am starting to get some of Ft Hood. Also, what is his assignment? If he's got e-mail, have him get ahold of me, and I'll help him. To the best of my knowledge there is not an active APRS contingent, but something just came up that I'd like to chat with him and TEXCOM about...

53. APRS Channel Statistics

From: Keith Sproul <ksproul@hardees.rutgers.edu>
Date: Tue, 3 Oct 95 18:55:24 EDT
To: aprssig@tapr.org
Message-ID: <CMM-RU.1.4.812760924.ksproul@hardees.rutgers.edu>
Rendered body type: text/plain

There has been a LOT of discussion going on lately about wides, gates, channel usage, etc..

The Macintosh version has for a LONG time had a window of STATISTICS, those

with Macs have seen this and have found it useful in watching the system grow.

With all of the discussion etc going on about this stuff, I have enhanced the capabilities of these statistics.. In the past, there were two graphs,

- * One showing packets/time for a 24hr period (5-minute intervals)
- * One showing packets/time for a WEEK period (1-hour intervals)

Just this weekend, I added the capability to show VHF packets vs HF packets, which has already proven very useful.

And just over the last two days, I have added a third graph which shows packets/time over a ONE YEAR PERIOD (1-day intervals), again, showing VHF in one color and HF in another color (assuming you have a dual-band TNC, which is a must to run a gateway).

All of this gives me the ability to actually quantify what is going on and see the difference between a busy period and a slow period.

The recent addition of separating the VHF vs HF has added a lot to what is shown with these graphs, and I have already gotten some good comments back from the couple beta-testers using this..

It is quite interesting to see usage spikes or swells on weekends and in the evening.. Now with the HF separated out, it allows me to tell when the propagation is getting better just at a glance..

This new version will be up on TAPR either tonight or tomorrow..

It will be MacAPRS 2.0.1

Bob, your last comment about the DIGIS etc was quite good.

Can't help in Austin much, but we do have a growing group on APRS in the panhandle (Amarillo). Activity here is also for the ARES WX net. As activity spreads throughout the state it would be nice to keep a record of who's on APRS, what freq, and what are they doing with it in their area. It would be kinda like the SIG list they are working on, but on a statewide basis rather than sig wide. Any thoughts on this let me know.

- > there was a way to get APRS to read 2 TNC's.
- > He listens to 10.151 and 145.79 but does not own a dual port TNC,

SURE! Just hook them both up! Connect both TXD lines to the PC TXD output so that APRS drives both TNC's, then diode-OR the RXD lines

together to the PC RXD input. Set both TNC's to 9600 (or higher) and this should work MOST OF THE TIME. Even for fully saturated nets on VHF and HF, At 19200 baud, each packet will only be active on the PC port about 6% for VHF and 2 % for HF. The chance of a collision will be small... But you will get some GARBLED packets when they do collide, so be prepared to take all packets with a grain of salt.

Also, you should have a toggle switch on the TXDlines, so that when you are MESSAGING on one band, you are NOT sending out packets on the other channel.

This DUAL BAND station will NOT be able to GATEWAY, but it should allow you to participate on both bands.

As far as APRS is concerned, just tell it you are on HF so that it will halve its timers and not overload the HF channel... (this will also avoid the "bitch warnings" when you use GATEWIDE on HF...

56. MFJ data radio

As I posted a week or so ago, I special ordered 5 MFJ 5 watt Data radios via my local amateur radio dealer. I paid list price of \$119 per radio and \$14.95 each additional to have them DELIVERED on 145.79. I got the box tonight, read the manual (yes I did!), and popped off the cover.

I am pleased with what I see. Now all I gotta do is find a TNC with true DCD and cable it up for some on air tests. The manual does warn that this amateur product should not be expected to operate in a commercial repeater site with comparable \$1000 radios...

Mine will be remotely located at isolated digipeater sites, but I will add a thermostat and heater to keep it somewhat temperature stable...

More later when I get them on the air. Weeks or more probably...

What's this I hear about a new MFJ data radio with 30w output???? Anybody else heard this. In line with efficient net operation, I'd like to see a 10w out radio, but not necessarily a 30 watt. Glad to see Bob got his order of data radios as promised. BTW, PacComm is shipping the Pico Packet model with 32K RAM installed for \$129, and has indicated the version w/second serial port will be available next week. Aloha, time to head back to the beach. Dave/WH6YC.

CAN'T FIND SCRATCH1.TMP - It didn't have enough lines to defrag.

END OF INPUT FILE - one of your points has a 0 (zero) in it.

Have I had these problems, you bet your bippy I have. Do I have a cure - Can't find - combine two maps and then defrag - END OF INPUT FILE use a text editor and go thru the SCRATCHx.TMP that's the largest,

looking for a xx.0 line point.

Rendered body type: text/plain

I may as well ask the question... What is the BEST weak signal MODEM? FM AFSK is the WORST. 300 baud FSK (HF) is poor. All the HF modems are targeted at the HF medium which is NOT white noise gaussian....

Wasnt there a BPSK, or one of the satellite modems that is supposed to give 10db improvement over conventional packet if used terrestrially...

I believe that TOM Clark W3IWI has long ago bounced a packet off the moon, but who will be the first to do an APRS POSIT?

The first EME weekend is coming up this friday..

We at the Naval Academy arent even hearing our own CW echos yet, so this is NOT an immediate quuestion...

61. Golden Packet

Rendered body type: text/plain

Back in 1979 when AX.25 began to support 8 digipeaters, there was talk of the GOLDEN packet award for the first transcontinental VHF packet. Did anyone ever claim that prize?

Would a double hop meteor scatter packet count? The rules I believe clearly said terrestrial, but does that mean NOT satellites or does it exclude MScatter too.

Anyway, an APRS posit would be a nice one.

Depending on the definition of the word Terrestrial, Balloons and

Aircraft may be out of it... but a tethered Kite could arguably count.

At 2800 miles, this means a digipeat every 350 miles...

Or could a doctored up APRS protocol that regenerated itself along the way count? Then it could takes dozens of hops. Even so, as soon as we see a string of digipeaters no matter how perverse from coast to coast, we outta do it just for fun. Already, a packet could go from Boston to Central virginia. Look at the APRS DIGIS.BK file. But we each only see our own miopic view. There is a gap through southern VA, but once into North Carolina, I think it could get to Alabama.

There should be a path through Ohio to Iowa or Missouri, but I dont know.

If your local DIGI is a BIG ONE, be sure it is in the DIGIS.BK file. Send me its POSIT string if it isnt. Lets dont clutter DIGIS.BK with EG0peaters, though, just LONG DISTANCE WIDES.

64. Illinois Balloon hst request

From: barrettd@crpl.cedar-rapids.lib.ia.us (David Barrett)
Date: Wed, 04 Oct 1995 02:19:53 -0500
To: aprssig@tapr.org
Message-ID: <199510040715.CAA20840@sys1.tapr.org>
Rendered body type: text/plain

Someone requested a history file of the Illinois balloon launch held last weekend.
Even though I'm a none ham I do have a scanner and a nice 4 element collinair antenna.
I hope it's okay to include a bak file in this message that has everything removed except for weather stations and wide stations (for those with no ftp access) I thought it would be useful when traveling the midwest.
The complete hsts file I've uploaded to ftp.tapr.org.
I'd be interested in any reports of the launch; as I preceive the gps unit locked up around 32,000 ft. What caused the lookup, was the package recovered, and was it df'ed?

barrett
ps the bak file may need some positional reformatting!

65. [Keith Sproul <ksproul@hardees.rutgers.edu>: [APRSSIG:3642] APRS Channel Statistics]

From: Keith Sproul <ksproul@hardees.rutgers.edu>
Date: Wed, 4 Oct 95 9:09:54 EDT
To: aprssig@tapr.org
Message-ID: <CMM-RU.1.4.812812194.ksproul@hardees.rutgers.edu>
Rendered body type: text/plain

MacAPRS 2.0.1 is now up on TAPR.

Both the 68k version and a PPC version are up on the TAPR ftp site.

ftp.tapr.org /tapr/SIG/aprs/uploads

MacAPRS 2.0.1 has the following features..

- * A lot of additions to the STATISTICS display, this was discussed in my previous message (copied below)
- * A couple of minor improvements to the Callbook database settings.
- * A fix to convert KNOTS to MPH when receiving GPS data
- * MacAPRS no longer transmits ?APRS? on the hour. This was done to reduce channel clutter

=====

There has been a LOT of discussion going on lately about wides, gates, channel usage, etc..

The Macintosh version has for a LONG time had a window of STATISTICS, those with Macs have seen this and have found it useful in watching the system grow.

With all of the discussion etc going on about this stuff, I have enhanced the capabilities of these statistics.. In the past, there were two graphs,

- * One showing packets/time for a 24hr period (5-minute intervals)

- * One showing packets/time for a WEEK period (1-hour intervals)

Just this weekend, I added the capability to show VHF packets vs HF packets, which has already proven very useful.

And just over the last two days, I have added a third graph which shows packets/time over a ONE YEAR PERIOD (1-day intervals), again, showing VHF in one color and HF in another color (assuming you have a dual-band TNC, which is a must to run a gateway).

All of this gives me the ability to actually quantify what is going on and see the difference between a busy period and a slow period.

The recent addition of separating the VHF vs HF has added a lot to what is shown with these graphs, and I have already gotten some good comments back from the couple beta-testers using this..

It is quite interesting to see usage spikes or swells on weekends and in the evening.. Now with the HF separated out, it allows me to tell when the propagation is getting better just at a glance..

In a message dated 95-10-04 01:27:24 EDT, you write:

>After much experimentation I have not yet gotten APRS to properly
>respond to my LOGITECH trackball.

I also tried to get my LOGITECH mouse to work with APRS, to no avail.

All my problems disappeared when I went to a local computer store and got a \$9.00 non-LOGITECH mouse. Now it works great! And I didn't have to change anything. Evidently, LOGITECH uses a different language that APRS doesn't recognize.

Incidently, by not getting a LOGITECH, I ended up getting a better mouse, too.

I believe that prize **was** claimed, but I cannot think of the details involved. I recall that a group in the Rockies helped give us some big hops...lots of high-gain beams in the middle...I wish I could remember more.

There was also the emergence of the east/west-coast 'wormhole' which connected a couple of TNC's (back-to-back) using the Internet as a serial cable....

I remember the days fondly, building TNC kits for other folks, and burning each one in for a week or two 'to check for weak components', since I could not afford to buy my own.

SUBJECT: HABET7.HST Posted
DATE : 04Oct95

Students of the Iowa State University (ISU) Spacecraft Systems and Operations Laboratory (SSOL) completed High Altitude Balloon Experiments in Technology (HABET) mission seven on Friday, September 22, 1995. HABET-7 was released from the ISU campus in Ames, Iowa and landed near Lisbon, Iowa east of Cedar Rapids.

Mission experiments included transmission of APRS compatible GPS navigation data at 10-second intervals. A resulting APRS history file (habet7.hst) has been posted to

<ftp://tapr.org/tapr/SIG/aprssig/upload/habet7.hst>

Preparations for HABET-8 are under way toward a mission in mid-November. More information will follow.

Regards, Ralph Wallio, W0RPK

Hi...

A friend and I have been trying since Friday evening to get our APRS programs and stations working properly. We are at the point where I receive his beacon which comparing it to the format in the docs looks correct. But I do not get a display of the station on my map. Also, from his position he can hear many other stations from New Jersey but does not get a display on his screen. We have tried various combinations of RELAY, WIDE, WIDE,WIDE, WIDE,RELAY, SPK,WIDE, SPK,WX3A, SPK,RELAY AND WM3L (SPK being a local packet digi in the area), and have had no luck with any. Also there is nothing in the Heard, Latest or All Beacons lists about either station.

My friend Ray, WX3A is using an AEA-232 TNC, and I have a PacComm TNC-220. BTW. As far as we can tell, we are the first and only operators trying this in our area...we hope to get more!

Hopefully, this is a start on the resolution of our problem but being so new at it, I'm not sure exactly what questions to ask or what info may be needed for a complete solution. If you can help us, and need more info please e-mail me.

Thank You.....Bernie, WM3L berlyn@epix.net

Make absolutely sure you have HEADERLN set to OFF on the PK232, and the equivalent command on the Paccomm. That was the key to getting MacAPRS working here, if that's the APRS version you are working with.

Good luck and welcome!

hi:

want a good discussion on modems check out the text files that are included in the meteor scatter program for paket. it can be found on the web under the NEWS page. it is a good text. i rx a note from the author that he can provide pc boards for anyone to build one, the design is based on the jas1 modem. i am trying to distribute this info to the ms gang so that APRS can give it a good go on ms.

75. 73C BUGS?

From: joe.garber@logon-philly.com
Date: Wed, 04 Oct 95 14:38:53
To: APRSSIG@TAPR.ORG
Message-ID: <9510041438.A5799wk@logon-philly.com>
Rendered body type: text/plain
TO: APRSSIG@TAPR.ORG

Hello to all.

Here are some observations on version 73C version. Don't know if they're bugs or whether I'm doing something wrong, but here goes:

- 1) When using the N command, the weather station is no longer circled on the map as in previous versions.
- 2) The one and ONLY station that shows up under the A menu is my own! Though other stations come up on the map and the L/P screen lists fill up, the

A listing remains vacant. I tried playing with every conceivable filter setting available...no luck.

3) To go along with #2 above: The program no longer beeps when I hear a new station. I tried all the various BEEP toggles and alarm settings but couldn't get it to work.

Hope these observations are of some use. By the way, I'm using a 286 machine with a PK-88 TNC. Version 73a shows none of the above symptoms.

Other than that, the program works well. The display of hurricane Opal is something to see.

Regards,
Joe

Message-ID: <199510041909.PAA28428@dylan.mindspring.com>
Rendered body type: text/plain

Glad to see that you got the MFJs.
What do you mean by "isolated digipeater sites"? Maybe someone's QTH on a hill? Are you the *only* thing there? Or are there other users? Are there any other 2M ham repeaters or any High Band business users? If so, watch out for desense of your receiver. You might still need a bandpass cavity to protect your receiver.

Also, even with 5 watts, I'd still make real sure the transmitter is clean. The cavity would help clean that up as well.
We just lost a really nicely located high digi. The operator was not using a bandpass cavity and was desensing the rx of the co located 2 meter repeater. The 2 meter repeater won. I think a cavity and / or notch would have licked their problem.

For anyone putting up digis: For less than the cost of that MFJ, you should be able to pick up a used commercial radio. I have been using Motorola Mitreks and certain GEs (MVP, EXEC II and MASTER IIs).

The last one I made, N4NEQ-2 is a \$40.00 Motorola Mitrek. We *paid* Motorola to tune it up (I didn't have time to do it). This cost 38.00 The crystals cost \$10.00 each and I needed no control head, speaker, or controls. I used discriminator audio output straight into a KPC3 (which can use unswitched audio). The TX audio went straight into the Mic. input. It can do 90 watts, but we have it set lower.

This is the best digi I have ever seen It is highly resistant to receiver desense and cost us less than one of the MFJs.

BTW-
My experiences with the Ramsey kit show that it is unsuitable for digipeater use if any other high band equipment is present nearby. Someone loaned us one to "get us through" a period of time while the Motorola was being tuned up.

According to Bob, APRS responds to only a *Microsoft Mouse on COM1*

The other person, who said he got a non-logitech mouse to work, must have been using a Microsoft mouse. Bob reads the serial data directly and doesn't support a mouse driver.

78. KANTRONICS APRS PORT SPLITTER

From: DDOBBINS@aol.com
Date: Wed, 4 Oct 1995 16:52:00 -0400
To: aprssig@tapr.org
Message-ID: <951004165159_36426462@emout04.mail.aol.com>
Rendered body type: text/plain

As mentioned in Greg LaBorde's msg to the SIG, Kantronics now has their own port splitter cable for APRS operations. They call it, surprisingly, the "APRS Cable". How original!

It's available now from Kantronics, and works with all their TNC's. Remember, you don't need a TNC w/GPS support unless you want to go standalone mobile. You can still have an old TNC and use Bob's port-splitter described in the APRS GPS.TXT ReadMe file, or now for \$29.95 you can get one pre-made from Kantronics. Add \$5.00 for S/H, and TAX if you live in MO, KS, MN, OH, IL, NE or SD. If you have a question regarding the APRS CABLE, you can call Suzi at Kantronics, 913-842-7745.

Of note, I have to pay \$10.00 S/H for delivery to Hawaii. But then, they'll deliver it to me on the beach, where I'm headed right now for more sun. Aloha, Dave.

Bob,

I bought one a couple of months ago.....rocked it for 145.79 <easy tuneup>
 and connected it to my KPC-3.....it has worked flawlessly since then.
 I can only get 3.5 watts out of it though, a call to MFJ confirms this <I don't
 have a perfect antenna match...> The front end is VERY selective, beating out several other radios I
 have tried. I have a commercial tower within 1/8 mile, and have always had receiver problems with
 pagers and whatever...this
 radio is not bothered by the RF. 8-). I have a freq. counter set up to monitor my outputs from
 various transmitters.....and this cheap radio is more
 stable than any synthesized rig I own!

Good luck and have fun,

Ken N3MQV

 Subject: [APRSSIG:3645] MFJ data radio

As I posted a week or so ago, I special ordered 5 MFJ 5 watt Data radios
 via my local amateur radio dealer. I paid list price of \$119 per radio
 and \$14.95 each additional to have them DELIVERED on 145.79. I got the
 box tonight, read the manual (yes I did!), and popped off the cover.

I am pleased with what I see. Now all I gotta do is find a TNC with true
 DCD and cable it up for some on air tests. The manual does warn that
 this amateur product should not be expected to operate in a commercial
 repeater site with comparable \$1000 radios...

Mine will be remotely located at isolated digipeater sites, but I will
 add a thermostat and heater to keep it somewhat temperature stable...

More later when I get them on the air. Weeks or more probably...

81. WANTED - 2M RADIO FOR APRS

From: DDOBBINS@aol.com
 Date: Wed, 4 Oct 1995 20:40:49 -0400
 To: APRSSIG@tapr.org

Message-ID: <951004204023_36623483@mail04.mail.aol.com>
Rendered body type: text/plain

The availability of a 2M commercial radio for conversion to an APRS digi on 145.79 is slim to none here in the Islands, so I'm asking the mainlanders to help me find a Motorola Mitrek or similar radio, about 30w out, for SUPER CHEAP that we can re-crystal and retune to 145.79. We're expecting an influx of new APRS users here on Oahu after the successful PacCon95 mtg last week, and besides, it's time to move from a more busy freq (145.05) to a dedicated APRS freq. Enuf preaching to the choir. I'd appreciate help in locating a good condition radio, and price is an object. Perhaps someone has an extra lying around???? OK, back to the beach. Aloha, Dave.

I' was also investigating the MFJ data radio. Am curious to see how it works out for you.
The Maxon unit is similarly priced, but the Radio Shack HTX-202 is \$199 on sale and has tunable band. What is the advantage of a "data radio" over a typical 2meter HT?
Is the FM signal different or more stable or anything? -k- N3MKP

It is all discribed in APRS\README\DF.txt and you can see it by loading the backup file DF-OMNI.BK and then hit the MAPS-PLOTS-DF command...

Stations report the following three bugs:

- 1) The A-LIST doesnt work.
- 2) The blue station circle does not work on the NEXT-WX station command
- 3) It doesnt beep on new BEACONS...

Last chance to tell me more, then ill compile 73d...

86. Packet statistics for the PC

From: n2czf@gate.net
Date: Wed, 4 Oct 1995 22:18:09 -0400
To: aprssig@tapr.org

Message-ID: <199510050218.WAA52268@tequesta.gate.net>
Rendered body type: text/plain

After recent discussions locally with some APRS users and one in particular who is writing his own packet statistics program I went searching for one. Keith has a wonderful program for the Mac that he wrote many years ago but not owning a Mac I was in a bind.

I have found on the TAPR ftp site MONAX.ZIP under the UTIL sub-directory. This program is no frills and very old (1987 hi hi) but it seems to be working so far gathering data. Many have been joining the sig discussion on channel usage esp. on VHF with the growing number of APRS users each day. If you have a TNC that can go into the KISS mode and interested try this program out. Do read the DOC.DOC file FIRST, if you thought APRS was unfriendly at the begining you ain't seen nutting yet!

Is there anyone reading this message that is good with EXCEL and importing raw data to create charts and graphs ? This program will also give you a file so you can do this, Lotus 1-2-3 was mentioned (what is that?? hi hi) but I am sure EXCEL can use this file also.

Let the sig know of any results...

Oh yeah... and I forgot to mention...

The Mitrek is 9600 data ready as well.

MOAMPS (the Missouri ?? ???? Packet ????) group was building a network of them across MO for packeteers. I got to see a great presentation from them at the TAPR annual meeting about 3 years ago.

We are using a UHF one for a 9600 baud full duplex packet repeater.

The MFJ (or Ramsey) is proly a great little radio for the house, but *please* don't put one at a commercial site. Use only commercial radios *with* bandpass filters. Some sites may even require use of an "RF Isolator" as well. It is good practice. Let's keep our commercial hosts happy with us.

Ralph

How close are we to 9600 baud packet data networks for APRS? A month?
a year? a decade? ever? It could be a capability that won't be
useful for a long time.

If one were to go buy a 9600 baud modem from PacComm (or from Kantronics with
some trepidation) one could do that pretty quickly. I know. I've got one up
here for the University.

Is anyone else developing or considering developing APRS maps of
the Central Washington State area?
Specifically, Kittitas, Klickitat, Benton, and Yakima county areas.

I have created two fairly complete maps of Northern Yakima county/
Southern Kittitas county, and the Greater Yakima area that have not
yet been released.

Maps are a lot of work so would appreciate coordination/colaboration
if anyone else is interested in this area.

I think I'd stick with Kantronics at this point. A few months ago, when they said they were real close to completion, I ordered a PicoPacket w/ serial & battery option. I'll have to look up the exact date, but 3-4 weeks have turned into months and I haven't heard anything (despite a couple of message to inquire the status). Now I haven't been billed for anything yet, and I know Kantronics Tech Support isn't known for it's excellence, but at least I haven't had a vaporware problem with Kantronics. (BTW I have NOT been billed for what I haven't gotten, but I haven't gotten the expected merchandise.)

In the meantime I explored, and invested in, a solution another reader on the list mentioned. I bought a PCMCIA (PC Card) Module for my PB520 and a Socket PCMCIA to Serial I/O card, thus giving me the ability to use both the GPS (Garmin) and TNC (KPC-3) on the single serial port Mac at the same time. I am real happy with the setup. The only complaint is that you must totally shutdown the computer to swap the battery for the PCMCIA module (rather than just sleeping), but this is relatively minor as bootup is only a short time.

PS - sorry for the previous post, I noticed that I was sending it to the list twice and in the process of cancelling it to retry I accidentally sent the message. My appologies to everyone who pays to get their mail ...

```

If you use the NEXT-WX key to cycle through to a given WX station, it will be displayed at the top of the screen. From then on, whenever a new WX report comes in from \*that\* station, then that station should be displayed at the top of the screen in the blue box.. And only that station, unless you change it by pressing N again.. To disable the function, press N until the box goes away...

This is the way it has always worked. If you are seeing something different, let me know ASAP. Thanks...

Gerry... (or anyone else), I understand that 9600 hardware is at hand, but my real question is, what is the outlook for significant high speed networking, especially with APRS?

Hardwire networking swiftly went from 300 to 1200 to 2400, on up to 28.8 just as quickly as the manufacturers could crank out the improvements. Largely, I think, because they maintained downward compatibility for two way hookups. But in radio we have the problem of multicasting packets, and the slow guys can't copy the faster ones. And there is a large installed base of we slowpokes and no analogs of nodes to convert between T3, T1, phone line, etc.

Does the operator with 9600 have to be content to throttle down to participate with the rest of the world and save the high speed for small dedicated QSO's? Do you see a quick conversion to 9600 and the old TNC's relegated to the junk box? I'm sure the TNC makers hope so. Shorter (time wise) packets would help QRM on APRS, but we don't seem to be near saturation yet. On the other hand, it wouldn't seem to help Bob B's problem with WIDE,WIDE, WIDE packets cancel ling each other.

I guess the thing that would kick off wide 9600 acceptance for APRS would be a small network of 9600 ONLY stations. Perhaps at it's own freq, and repeated at slow speed on .79. If it's successful: higher throughput at significantly higher effective speed, people would be tempted to convert. (Is there a problem trying to talk to your GPS @ 4800 and the world @9600?)

Cheers,

Bob Kirk

Greetings from TAPR!

TAPR can be reached via the Internet. The Automated Information Server that TAPR provides allows anyone to request information on TAPR, products, newsletters, and lots of other files. To find out more about this service, send an e-mail message to [listserv@tapr.org](mailto:listserv@tapr.org) with the subject line "Request" and the following text in the body of the message:

```
help                (for a brief set of instructions)
index -all          (for a list of all file by topic area)
list                (for a list of TAPR Mail Groups)
get tapr taprinfo.txt (or info on TAPR)
```

In the above message example, "help" retrieves a brief set of instructions for info, "index -all" retrieves a list of available files by topic and "taprinfo.txt" retrieves a text file containing information on TAPR and what TAPR is all about. If you want to retrieve several text files with one message, use a separate line for each "get filename" request.

-----

#### Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list of SIG groups, send an e-mail message to [listserv@tapr.org](mailto:listserv@tapr.org) with the subject line "Request" and the following text in the body of the message:

```
list                (for list of mail groups on TAPR.ORG)
```

To request the information on any mail group, send an e-mail message to [listserv@tapr.org](mailto:listserv@tapr.org) and in the message text include:

```
information listname (where listname is the name of the mail group)
```

When you are ready to subscribe, send e-mail to [listserv@tapr.org](mailto:listserv@tapr.org) with the following command in the message text:

```
subscribe <list> <your name>
```

List should be the name of the mail list you want to join and Your Name should be both your First and Last Name. BE SURE NOT TO USE THE "<" and ">" in your message. Example: subscribe aprssig John Jones

Current SIGs include:

|          |                                                        |
|----------|--------------------------------------------------------|
| NETSIG   | Regional Networking SIG                                |
| BBSSIG   | BBS SIG                                                |
| HFSIG    | SIG on HF Digital Topics                               |
| DSP-93   | SIG for those that are building TAPR/AMSAT DSP-93 kits |
| APRSSIG  | SIG on APRS                                            |
| TAPR-TNC | SIG on TNC Issues                                      |

|         |                                                         |
|---------|---------------------------------------------------------|
| TAPR-BB | Announcement channel for TAPR bulletins and information |
|---------|---------------------------------------------------------|

-----

#### FTP users

The TAPR Software Library is now available via anonymous FTP. You can access the library by ftp access to 'ftp.tapr.org' in the directory /tapr. Login in as 'anonymous', with a password of 'your\_account@internet\_address'.

-----

Packet Raido and TAPR is on the World-Wide-Web!

The series is accesible through the Packet Radio Home Page at this URL:

<http://www.tapr.org>

What's here? A page of links (the Home Page), the TAPR Home Page, a page of Packet Pioneers and Contacts, a hypertext packet primer and FAQ, and more.

>repeated at slow speed on .79. If it's successful: higher throughput at  
>significantly higher effective speed, people would be tempted to convert.  
>(Is there a problem trying to talk to your GPS @ 4800 and the world @9600?)  
>

I live in an interesting area, for both 9k6 baud and APRS. This is a geographically isolated, technical community of about 50,000 people (China Lake), and there is quite a bit of packet activity. As the sysop of the local BBS, I did the first 9k6 nodes in our area to give us a higher-speed link towards Los Angeles. Although I chose a "user" frequency, and I heavily advertised the fact that you could login at 9k6 baud to the BBS, it wasn't until almost 6 months later someone else here used 9k6 baud! Almost 2 years later, we have 4 people on 9k6 baud. Coincidentally, the people who have experimented with TCP/IP, 9k6, and APRS are pretty much the same people!

Due to this, I am seriously considering switching the APRS activity to our 9k6 channel (it's way easy to do that with only 4 people :-). The only problem would be our mobiles, who don't have 9k6 capability. I may look into getting a Kantronics 9612, which could do both 1k2 and 9k6 simultaneously, and digipeat between the two channels. This may be the way to go for some areas, I'd think. Hmmm...the digi aliases would be interesting to setup, huh?

>DCD and cable it up for some on air tests.

Is True DCD really an option to improve efficiency of the network? TAPR is  
selling a small board that fits in almost every TNC to provide true DCD and  
unspelled operation (info at: <http://www.tapr.org/tapr/html/dcd.html>) for 20\$.  
We should consider this option, any comment?

Bernard, KB2TGH.

Message-ID: <Pine.PCW.3.91.951005182230.8431A-100000@gruff>  
Rendered body type: text/plain

The correct way to subscribe should be to send mail to:

listproc@tapr.org

the body should read (not Subject:)

subscribe aprssig address

The address are your email address, not your name. My initial subscription  
request was sent to listserv, but I think it should really be addressed  
to listproc as N9VJQ states here. For more info you could email listproc  
with only HELP in the message body and all info regarding subscribing,  
changing address and unsubscribing will be returned.

## 106. San Diego Map

From: Pat Bunsold <pbunsol@cati.csufresno.edu>  
 Date: Thu, 5 Oct 1995 11:44:14 -0700  
 To: aprssig@tapr.org  
 Cc: keating@nosc.mil  
 Message-ID: <199510051844.LAA04627@CATI.CSUFresno.EDU>  
 Rendered body type: text/plain

The new San Diego APRS map, a very nicely detailed and accurate map by  
 Dave WH6YC, is now available on the Radiosport LL BBS at (619)279-3921.  
 download CA\_SDGO.MAP (about 39K so fast for even 2400 modems!)  
 The new Southwestern California map will also be uploaded as soon as I  
 get a copy. When in San Diego, tune to 145.79 for APRS activity. We have  
 a major WIDE node on Mt Otay giving excellent coverage from Mexico up to  
 many parts of LA. There are some cranks on 145.785 so Orange County  
 activity might see some QRM. Just go QRO! Hopefully we will see a LA  
 area node on 145.79 so there will be continous coverage up the coast.  
 TNX to all on the map for making San Diego a hotbed of APRS activity!  
 73, Pat WA6MHZ, Flinn Springs

 >  
 >Bernard, KB2TGH.

True DCD allows you to run your radio with the squelch open. This cuts the amount of time needed for the sending station to run TXD before actual data is sent. If everyone runs a shorter TXD, the congestion on the channel might be reduced. I've done a lot of testing and have found that TXD as low as 5 (50 msec) works when talking to a radio with true DCD and open squelch.

Of course, the TXD also provides time for the sending transmitter to "ramp up" to the correct frequency and full output power. So, for some radios, extremely low TXD settings may not work. To be safe, I usually run TXD 20 to 30, although I've never found a station that I can't connect to when I'm set at TXD 20, even if the other station is NOT running open squelch and true DCD.

It bothers me when I listen to a packet channel and hear stations that are running excessive TXD. Some stations sound like they are running TXD 100 (a full second of nothing). These people must really like to make sure their rig has plenty of time to crank up and get running in transmit mode. Maybe they are using bicycle power. (Then you get the user that sets CWID ON so his TNC sends his callsign in Morse every 9 minutes, using the high-low modem tones...well, I'll save that for another thread...)

As a general rule, I believe that if the TXD period is audible to the naked ear, it is probably too long. A good test is to listen to a station using a squelched radio. If, after breaking squelch, you can hear the TXD period before actual data is sent, you can safely back the TXD down. In my own tests, I've noticed that backing down the TXD can cut the total on-air time for a typical packet transmission in half, depending on the amount of data being sent. For short protocol packets this is especially true.

Setting short TXDs may have negative effects on throughput though. I remember reading or hearing that everyone on a channel needs to run the same TXD setting or it flubs up AX.25's collision avoidance.

Jack

But have you tried the MFJ \*at\* the local pager tower. That is what I am talking about. I'll bet money it won't work at a hostile site.  
But as i said: "It should be fine for the home station" (unless you live at the pager tower :) )

Notice above, in your message, at the bottom. You attached some sort of file. What is that about?  
Do you have something set wrong or do I? No one else's messages do that, but both of yours have.

### 113. Beta testers needed

From: Gerald J Creager <gerry@cs.tamu.edu>  
Date: Thu, 5 Oct 1995 19:30:17 -0500 (CDT)  
To: aprssig@tapr.org  
Message-ID: <199510060030.TAA14807@solar.cs.tamu.edu>  
Rendered body type: text/plain

conv100d.bas is available for limited (LIMITED!) beta testing. I think it's ready for prime time, but would like a couple of the experienced folks who do 1:100k maps to give it a try.

CONV100D is specifically pointed at DLGs from the USGS FTP site, brought in via internet. It will block the data correctly and then carry the file through to the completion of conv100's normal activities. There are some things it still needs (liek a VB interface :-)) but I don't have time for that right now... maybe next week?

Anyone interested in testing drop me a note at n5jxs@tamu.edu and I'll tell you where to get it. If I get positive feedback I'll post it on TAPR.ORG soon.

73, gerry

### 114. aprs73d release

From: Bob Bruninga <bruninga@nadn.navy.mil>  
Date: Thu, 5 Oct 1995 22:01:50 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.951005212421.4418B-100000@greatlakes>  
Rendered body type: text/plain

Again, my FTP site will not accept my KERMIT upload, so I am posting it on 410 280-2503. Will the first person that gets a good download, please FTP it to TAPR? Thanks...

Aside from fixing the A-LIST and NEXT-WX command that got broke somewhere, I just added a neat feature. It allows you to repsond to messages while driving with 3 single KEYSTROKES!

\* F2 is now a REPLY command. It will grab the FROM call from the last message and begin a new message to that station and go right to the message prompt.

\* If you enter a SINGLE DIGIT number as a message text, APRS will copy the text from the Nth existing SEND message on your screen... (as long as that message does NOT have an \*ACK\* on it...)

\* ENTER. This KEY will send the message...

To facilitate this capability, I have also made APRS IGNORE any message sent to MSG... This means you can preload several common messages that you may want to use while mobile such as:

To MSG :Hi, just passing through on my way to Timbuktoo.  
To MSG :Rig is a peanut whistle, PicoPacket and Garmin GPS  
To MSG :Cant Keyboard while driving, but Im listening to 146.52  
To MSG :CUL, 73. Tnx fer contact. I gotta get back to the wheel...

Then all you gotta do is select from the list. You can even use text from messages sent to others, as long as they have not been ACKED. Gee... and I thought there were no more bells and whistles! Thanks to WB3V for this suggestion...

---

### 115. (no subject)

To connect your HTX-202 to a KPC-3, follow the directions for wiring a Yaesu Hand-Held Radio in the KPC-3 Getting Started booklet (page G8).

Or, if you don't have the booklet, use the diagram below.

```
=====
      TNC                                     Radio
      Audio Out  -----||-----  Tip of Mic plug
                        C1          |
      PTT Line   ----\\//\\-----|  Ring of Mic (not connected)
                        R1
      Audio In   -----  Tip of speaker plug
      Ground    -----  Ring of Speaker plug

      C1 is a 0.1 mfd capacitor of any type, R1 is 2200 ohms.
```

I use the HTX-202 with a KPC-3, and this works for me.

Rendered body type: text/plain

For anyone who is interested, I rigged up a simple squelch circuit for the MFJ data radio using an LM311 comparator chip. This seemed to work ok for the balloon launch but I was unable to test the squelch circuit as much as I would have liked. This circuit would be useful for those who do not have a TNC with DCD squelch.

Those who are interested in the circuit can write me.

Michael

## 121. PK-232 will monitor its own packets

From: "Charles W. Davidson" <cdavidso@hemisphere.neocomm.net>  
Date: Fri, 6 Oct 1995 11:07:31 +0000  
To: aprssig@tapr.org  
Message-ID: <199510061506.LAA25338@hemisphere.neocomm.net>  
Rendered body type: text/plain

Hello

I read a message earlier that stated the Pk-232 was not capable of monitoring its own packets. If you turn MXMIT ON all sent packets will be monitored just like recieved packets.

However I see in the startup file in APRS73D MXMIT OFF . So "BOB WB4APR" !help! Does this need to be off?

While talking about tnc's I'll just throw in my opinion on the best and worst that I have experience with.

PK-232 By far the best for picking out the weakest signals. All around the best a lot of money can but.

Paccomm Is my second choice, great support from the people on Florida.

MFJ Well, often exagerated in advertisments, there products somehow escape quality control inspections. Sometimes things like the TNC switches have to be modified because the misalignment of the case in relation to the circuit board prevents use of the provided plug in.( I have seen 5 like this). However Mfj does support Streamdouble or Channel double.

Kantronics Gets last rating only because it does not support Streamdbdouble or ChannelDouble. If you never intend to talk to more than one station at a time and you will never monitor a frequency with binary transfers on it, then the Kantronics will be ok.

BayComm Good buy for cheap substitute/standby/portable.

MfjCommador64 Plug in board The \$50 model In my experience if you get

one that works it will probably last at least a year before a chip goes out.

Stream Double or Channel Double  
(same thing just different manufacturers use different names).

If you do not have this turned on your tnc may interpret binary signals as streamswitching characters. Your tnc would then switch between channels at random. The default stream switch is usually ascii character \$7C or the pipesteam | . With streamdouble on it takes two of these to be recognized as true streamswitching command . Example ||2 or ||A would switch you to your second tnc channel. (Some tnc's use alphabet some use numeric labels for channels) By requiring two of these characters it is less likely a random binary character will bother you. A good software program such as Paket6.1 will automatically insert the two characters for you.

Paket6.1 Shareware program is the best tnc interface I have found. It is available from my home page....

2 cents from Charles in Axton, Virginia

p.s. Does anyone else think there is too much repetition of messages ? For example to give your comments to this mail you don't have to include this whole letter in your reply again and again. Why not reply to Subject PK-232 MXMIT or to My favorite TNC's. Of course if it's needed for clarity please include the original message. 1 more cent worth

Enjoy Ham Radio and The Internet!! Charles

## 123. Re: [APRSSIG:3705] RADIO SHACK HTX202

From: CCVFS.DRAWING@capital.ge.com  
Date: Fri, 6 Oct 1995 12:47:36 -0400  
To: "aprssig(a)tapr.org" <aprssig@tapr.org>  
Message-ID: <0013800001208109000002\*@MHS>  
Rendered body type: text/plain

A prior message stated that they wired the cable for a Yaesu HT, I originally wired mine as an Icom and had no problem either. At a later date I rewired it and left the capacitor and resistors out completely and once again it worked flawlessly.

However when I initially set up the cable it I could 'hear' ok but could not connect. I had to open the tnc and set a jumper that increased the range of the output level adjustment. I don't have a manual here at work but I believe it was J12 or J13. The manual also states that there is a jumper to set for use when using a HT to pull down the ptt line. I tried the jumper in both directions and it really didn't have any effect on operation however I have left it in the 'HT' position.

Hope this helps,  
Dana

I just got a MFJ TNC to Radio Cable for kam for \$14.95 from TUCKER.  
Part number MFJ-5024YV ,it works for most ICOM and Yaesu HTs.  
Both ends of the cable are pre-made.

It is like the 2AT style interface on page 100 of the KPC-3 book.  
The Cap is the same 0.1 but the resistor is 3300 Ohms not 3900 Ohms.

Works fine on my HTX-202, HTX-404 and ICOM W21AT

I only need to turn the vol. control on the 202 a bit less than a 1/4 turn  
I use the Software CD on the KPC-3 TNC and put the squelch full  
clockwise for remote tracking and midway for relaying.

## 127. Data radio 9600 baud

From: kc5ejk@onramp.net (Robert Winingham)  
Date: Fri, 6 Oct 1995 13:17:26 -0500  
To: aprssig@tapr.org  
Message-ID: <v02130502ac9b1fbf507f@[199.1.11.128]>  
Rendered body type: text/plain

I have two HTX-202 units I use for remote tracking and APRS use.  
These unit put out 8+ Watts when powered by 13.5 - 14.00 Volts.  
(The HXT-404 70 cm HT does only 5 Watts.)

For only \$40 more you get a radio you can tune and get a few more watts.  
(Gee, it is even a back up HT)

Think about getting the Radio-Shack extended warrenty if you are going  
to run it a 8 watts as a digipeater.

I also found a 9600 baud mod for the HTX-202.

### ----- CONNECTIONS TO REALISTIC HTX-202 FOR 9600 BAUD PACKET

NOTE: The following operation requires soldering in very close quarters  
and damage or destruction of your radio is possible if you get too much  
heat on nearby wires or components, or by sloppy soldering.

I performed these operations on my own HTX-202 and it works OK for  
9600 baud operation with my new Kantronics KPC-9612. I don't take any  
responsibility for invalidation of warranty or improper operation of the  
radio, etc.

I studied the schematics and determined the locations for making  
connections based on general recommendations for 9600 FSK. I didn't  
want to permanently deface my radio by making any holes in the case for  
wire penetrations, so I removed the battery and battery connector which  
is a plastic oval with a spring contact in it held by two screws and ran  
the wires out to the connector that goes to the TNC. I can restore it  
to original condition in just a few minutes. I used the smallest coax I  
had avail, I think it is RG-174. Someone may have a better idea about  
doing that part.

Open up the HTX-202 by removing the five screws, take off back cover,  
and separate front panel and lay it on bench so that flex pc cable won't  
be damaged.

This is a crude diagram of the inside of HTX-202 after splitting  
case and folding front case aside. There are several sub-PCBs  
standing on edge that I represented by the dashed lines. In my HTX-202  
the sub-board at upper left is labeled HF and the raw output from the  
discriminator IC goes into pin 1, the first solder pad starting from  
the center of the radio. This is where I soldered a small coax and ran  
it out the hole in bottom of case. This is Receive Audio into TNC.

The sub-board labeled MIC is microphone audio to modulator varicap. Pin 6 here goes directly into the VCO and this is where I soldered a second coax. The solder pad 6th pin from center of radio is right next to the RV1 deviation pot. (Don't melt the pot.) This is Transmit Audio from TNC.

The third connection, PTT, is harder to describe the actual point. What I did was flip the radio over and used a ohm meter to locate the solder trace from the center pin contact of external mike socket. It runs from just below mike socket to a small SMD resistor. I soldered a 2k resistor here and ran a tiny wire from other end of it, along the side of radio and out a slot in case where the cover wouldn't pinch it, and through the hole in the bottom.

The radio now has to be operated by a power supply, since the battery contact is gone and the wires are coming out the hole in the bottom. I lengthened the power wire that was removed from the contact and connected it to the same power supply as my TNC. The coax and PTT wires go to the DB15 connector for the KPC-9612. I used the coax shield for RX Audio as the ground connection, but left the TX Audio shield un-grounded at the DB15.

I am still in the process of evaluating how well this works on 9600 baud packet. There are very few VHF 9600 baud stations near me (only one, in fact) but hopefully in the future this will change. Good luck, and I welcome any feedback about this.....

> Re: [APRSSIG:3714] Central Illinois Balloon Association HST  
> From: RonN9QGS@aol.com

I'll take a try at making the conversion, Ron. You can send the file to me at the e-mail address below. If you would, please also send me the record layout for the existing file, not sure I know what:

"its in the regular packetd format" is.

Also: Attention Bob Bruninga: Bob, would you send me a copy of the record format for the HST files?

With an official definition of both of those records, it ought to be pretty easy to make the conversion (assuming, of course, that they CAN map to each other!). :).

## 129. Re: [APRSSIG:3710] repetition? . . . repetition?

From: ASZ@aol.com  
Date: Fri, 6 Oct 1995 14:42:02 -0400  
To: aprssig@tapr.org  
Message-ID: <951006144202\_71579882@mail02.mail.aol.com>  
Rendered body type: text/plain

In a message 3710 95-10-06 11:24:43 EDT, you write:

>p.s. Does anyone else think there is too much repetition of messages ?

yes yes yes yes yes yes yes yes yes yes!

No details at this point.

All I want to do is put up a 1 watt Picosat AX.25 FM 2 meter 1200 baud packet transponder for digipeating SHORT UI frames only. (Position reports) The conventional FM is for maximum participation by low budget schools and students... etc...

5 watts if it is a piggyback payload...

If I am going to do this in 6 months, I will need SERIOUS help. Does anyone have any closet space parts that they can spare? I am thininking of a TNC, radio, and power supply only. Using a PacComm TNC, that gives me two on/off functions and 4 channels of analog telemetry, plus the digipeater, or course.. I want it simple.

---

### 133. NMEA -> HST conversion

From: Ralph Wallio <WALLIO@dsml.dsmnet.com>  
Date: Fri, 6 Oct 1995 17:13:51 -0500 (CDT)

TO : Ron, N9QGS RonN9QGS@aol.com  
CC : aprssig@tapr.org  
FROM : Ralph Wallio, W0RPK wallio@dsml.dsmnet.com  
SUBJECT: NMEA -> HST Conversion  
DATE : 6 Oct 95

Ron,

I have converted many high altitude balloon mission GPS telemetry files to APRS.HST format (see habetx.hst files in ftp.tapr.org). My process is as follows:

- 1) Use wordsmithing to remove everything from the GPS telemetry file except NMEA sentences. I use WORDSTAR's non-document mode for wordsmithing. The find-and-replace feature makes it reasonable to quickly remove unwanted headers and chatter from 100K+ raw files.
- 2) Attempt to fill-in any missing navigation frames from data received by other stations. HABET transmits GPS time-stamped frames every ten seconds via low-speed telemetry. The time stamp field makes it easy to detect missing frames. If a frame is not available from any receiving station, simple inter-frame interpolation can be used (but flag the data as such .. I use a ?? in the two-byte frame check sequence field).
- 3) Use a PC, terminal program and TNC assembly to transmit the clean data to a second APRS-equipped assembly. Radios are not necessary ... use an audio connection. I turn the APRS motion filter off to allow more .HST records to be created.
- 3) Depending on the number of NMEA frames, APRS may create multiple .HST files. Use wordsmithing to combine these files in a single master .HST file.
- 4) Use wordsmithing to remove data from each .HST record which is not required for successful APRS replays. I use resulting space in each record to add important mission information. (See habet7.hst file in ftp.tapr.org/tapr/SIG/aprssig/upload.)
- 5) Load fully processed .HST file to \APRSnnn\HSTS sub-directory and enjoy the results.

Read Bob's message ref the APRS Satellite opportunity. In reality, Bob was on his knees begging for room in the MAR96 payload. HI HI.

Now, for all seriousness. This is a golden opportunity for all of us hard-core APRS addicts to help the cause. Whether you're validated or not, interested or not, subscriber or not, or Ham or not, it's time all of us to make a \$5.00, that famous Abe bill, donation to Bob's efforts and requirements to make the APRS Satellite work. I pledge \$5.00 right now, and will send it in tomorrow's mail (the mailman picks it up from me on (you guessed it) the beach. I encourage all to do the same. Perhaps Bob will etch all of our call signs into the skin of APRS 1 (my name suggestion). If you've got other ideas about configuration or capability, pass that on to Bob also. Important thing is that we all do something about this RIGHT NOW.

So help out the cause. Send \$5.00 to Bob Bruninga, WB4APR, 115 Old Farm Ct, Glen Burnie, MD 21060.

Thanks all. Now it's back to the beach. Temp 82 degrees, tradewinds at 4 mph. Aloha, Dave.

Rendered body type: text/plain

Hello, did anyone else get dropped by the TAPR list processor ??  
I finally came to this conclusion after 2 days of no sig mail and decided to re-subscribe thru the TAPR home page.

I see messages RE: a APRS payload (missed the original) and one RE: Commercial Radios! Wonder what other hot topics were missed in 2 days ? This sig is a "hopping" one.

On that note anyone have any experience converting Motorola 800 MHz radios over to the 902 ham band ?? Got a few of these and they sure would make some nice backbone radios if we ever got the ROSE code done up for APRS support.

### 141. I'm off for now

From: jeff.brenton@espi.com  
Date: Fri, 06 Oct 95 22:43:58 -0500  
To: aprssig@tapr.org  
Message-ID: <9510062243.0VX0U0J@espi.com>  
Rendered body type: text/plain

Due to time constraints (namely, I'd like to get SOME sleep at night!), I've signed off of APRSSIG for an undetermined interval. I will be available by direct mail, but will only read the SIG through the monthly summaries for a while. Just too many projects going on, with one helper out of service because of a new baby and other commitments.

If anyone needs to get ahold of me, you can use any of the following email addresses:

jeff.brenton@espi.com  
jrb@espi.com  
76703.1065@compuserve.com

The last address is the one I check most frequently - usually a dozen or so times per day, being a SYSOP. The other two are my BBS, which gets along without constant supervision, so it only gets checked once a day or so.

Type at 'yall later!

Bob, Dr. Tom Clark, W3IWI at NASA Goddard (Crustial Dynamics) could be a big help. He typically advises using non-space qualified parts since his experience shows they withstand the rigors of space very well -- not to mention that space flight parts are *very* expensive. We have a space flight design lab and clean room at my place if you care to take a look.

Date: Sat, 7 Oct 1995 13:41:39 -0400  
To: aprssig@tapr.org  
Message-ID: <951007134139\_38714908@mail06.mail.aol.com>  
Rendered body type: text/plain

OK, I was a little quick on the draw ref yesterday's request for SIG to send Bob \$5 to help out with the APRS Satellite project. I saw the satellite while visiting Bob in 94 and was quite excited about it then, and really excited (I hollared YES !!!) when I read Bob's msg yesterday. If you missed Bob's note (maybe you were on the beach too) he says the Academy will fund the project, so DON'T send him anything other than your APRS validation fees. Looks like a nice set rolling in, so it's back to the beach (what else). Aloha, Dave.

I signed on to AOL, which is my "onramp provider" and got all my APRSSIG messages and as the last thing it did was to automatically download a file named 1193PCX.ZIP to me... I had no idea where this file came from as it did not appear to be attached to any email... hmmm...

Wary as I am of viruses, I apprehensively unzipped the file into its own subdir and voila... there's APRS73D... complete with all its MAPOs, HSTS, BKs

etc... How did this happen? Does anyone on the SIG here know? If someone is doing this as a service, they need to know it's no service when I already had this a day or so ago and it costed me extra to stay online while the transfer occurred.

I've been receiving other files the same way, but cancelled the download, not knowing what was happening and again not wanting to incur toll charges unnecessarily. I have received "advertisements" in the past... totally unrelated to the SIGs I subscribe to...

Does anyone know what's happening?

I have had this happen too. Not a file that big,. but I have received two "attached files" to messages.

I think it is people using Windows 95's IP suite for some reason. I contacted the person the mail came from and he says he has no Idea how it happened.

The files I get are called things like ARSSIG1 and APRSSIG2

## 151. APRsat

From: Bob Bruninga <bruninga@nadn.navy.mil>  
Date: Sat, 7 Oct 1995 21:42:04 -0400 (EDT)  
To: aprssig@tapr.org  
Cc: amsat-bb@amsat.org, w3iwi@amsat.org  
Message-ID: <Pine.SUN.3.91.951007204605.21543C-100000@greatlakes>  
Rendered body type: text/plain

The objective of the APRsat is to relay very short UI frame packets containing position reports of the form WB4APR>FM19dx-1:\*status\*. These packets contain the Maidenhead Grid Square in the TO field and result in a very short packet. To do this, all we need is a standard TNC digipeater. The AMSAT APRtrak program will plot these position reports on a map.

Beyond these fundamental requirements, here are some other considerations and enhancements:

- 1) Downlink on 2 meters ax.25 1200 baud FM
- 2) Uplink on 2 meters (if possible) else 435
- 3) Use PacComm TNC which has 4 analog telemetry inputs and 2 outputs for basic telemetry.
- 4) No other CPU on board. Hardware reset of TNC at each sunrise.
- 5) Modify TNC code so no digipeater field is used. Digipeat based on the TO-SSID. This would allow for 15 different addressable APRsats on the SAME frequency and save 8 BYTES or 33% of every packet! ALL APRsats would digipeat -0 packets.
- 6) Avoid abuse by moding TNC to restrict digipeats to POSITs only
- 7) Put a GPS on board to report satellites position.
- 8) Modify the TNC so that it will only DIGI ONE packet per call per orbit
- 9) Modify TNC heard log to include POSIT and interleave previously heard posits from up to 80 minutes prior into downlink so stations can see posits from other side of world (on same orbit)

The biggest problem and earliest one that must be solved is the FREQUENCY PLAN. As an educator, I think that DOVE is one of the BEST investments of the AMSATS due to its simplicity and availability to students worldwide. That is why the APRSat downlink should be on 2 meters. But looking at the difficulty in getting MIR and SAREX frequencies, this may be a problem. As a starter, would it make sense to re-use 145.55? The probability of interfering with MIR or SAREX on that frequency is only around 1 % and if we don't re-use that frequency in SPACE, then the terrestrial packet users will...

Rendered body type: text/plain

I tend to agree that Mir has been such a success for this very reason. I suspect a note on AMSAT-BB will elicit some well thought out pro and con responses, as well as a few crackpots. You need to continue to push, and emphasize the target of opportunity as well as the short duration of the mission (It's gonna be battery, few to no solar panels, LEO, poor mass to drag ratio, etc.).

## 153. No APRS in So. Ca.?

From: JeffS5@aol.com  
Date: Sun, 8 Oct 1995 03:06:51 -0400  
To: aprssig@tapr.org  
Message-ID: <951008030649\_39118088@emout06.mail.aol.com>  
Rendered body type: text/plain

I turned on 145.79 today from the Santa Clarita Valley (extreme N. LA County) and quickly logged 25+ APRS stations: 4 in San Francisco, 1 in Texas, 1 in Midwest, and the rest in San Diego, 3 were Wx stations too. Obviously the HF Gateways are working from the Bay Area.

BUT, looking at the map after being on all day Saturday, the only APRS station on .79 for 100+ mile is me! L.A.'s a rather boaring city eh? True there is minor activity elsewhere on the band, but if I were to park somewhere, it'll be on .79 even though it's all DX from here. Maybe a WIDE in L.A. will fix it.

## 154. Bit mapped maps

From: Bob Bruninga <bruninga@nadn.navy.mil>  
Date: Sun, 8 Oct 1995 11:11:12 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.951008110813.22483A@greatlakes>  
Rendered body type: text/plain

I should be able to use BIT maps in APRS, if someone can give me the format and or a Qbasic routine for drawing them on the screen. This means the code for reading a bitmapped image and drawing it on the screen, whatever it is.

Also, what are the typical formats used by the bit map makers? .PCX, BMP, BIF? or whatever?

---

## 155. 4800 baud standard

From: Bob Bruninga <bruninga@nadm.navy.mil>  
Date: Sun, 8 Oct 1995 11:14:52 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.951008111121.22483B@greatlakes>  
Rendered body type: text/plain

In version 73D, I changed the default baudrate to 4800 to match the TNC when it is used in GPS mode. This may cause some problems for new users who are used to APRS defaulting to 9600. My recommendation is to still run 9600 if you are not sharing the port with a GPS. Also, I display the baud rate on the CONTROL-PANEL now.

cc: Jerry T. Swain \ PRODIGY: (CMPK59A)

Bob,

Is that to say that if you can figure a way to do bitmap graphics that I could use an overhead "photo" of the area as my map???

If that's true, we need to get access to LandSat images or talk our aviation buddies into a flight over the area!!

Think of the implications! Accuracy, realism, terrain color, density of population, location of obstructions such as mountains, location of aids such as digis, repeaters...

Firefighters, rescue, CAP, bike rally coordinators, DFers, hunters, campers, travelers... Imagine the applications!

Even without using overhead photos, the upgrade to bitmap graphics will be worth the effort!

## 160. MFJ Data Radio Squelch Circuit

From: Michael Markmann <ve4mjm@draco.bison.mb.ca>  
Date: Sun, 8 Oct 1995 15:05:33 -0600 (CST)  
To: aprssig@tapr.org  
Cc: Michael Markmann <ve4mjm@draco.bison.mb.ca>  
Message-ID: <Pine.LNX.3.91.951008150257.2978B-100000@draco.bison.mb.ca>  
Rendered body type: text/plain

Simple squelch circuit for the MFJ Data Radio:

The Motorola VHF Receive chip that is used in the MFJ Data Radio has a Received Signal Strength Indicator (RSSI) output on pin 12. MFJ has thoughtfully put a test pin on the board from this pin. Using this pin and TP1 (I believe that's what it is; I'm going from memory) which is the audio out from the discriminator, I have built a simple audio squelch circuit. The schematic is as follows:

The circuit is a simple comparator: when the voltage at pin 3 (RSSI) rises above the preset voltage at Pin 2, the transistor turns off and audio is passed out of the radio. When the voltage falls below that of Pin 2, the transistor turns on, muting the audio.

The resistor values are not critical. I found that 0.6V was a suitable level for Pin 2. A variable resistor would allow you to adjust the squelch level.

A further addition to this would be to mute the audio while the radio is transmitting. This may or may not be a problem with your TNC but since the receiver is always operational, even during transmit, your TNC may be confused or APRS may not function correctly. I have not been able to investigate this possible problem as the radio is crystallized for 145.790 and there is no activity here in Winnipeg on this freq. A possible fix would be to use a diode from the audio test point to the PTT line.

I hope someone finds this useful. Send any questions and/or comments to me direct and not the sig.

Michael

> aviation buddies into a flight over the area!!

```

In my GIS lab, we've been doing quite a bit of work with mapping, and overlaying Landsat images. It's non-trivial.

If you do not have the same projection for image and base map, you're not going to get good (read, "USABLE") registration. Then, differentially corrected or no, you're out in a field, or somewhere unreliable, rather than where you think you are. It's really not as simple as it sounds.

It may be possible to do something like overhead imagery registration, but I know I will not have time to work on it for 3-6 months... unless something like that pops to the surface in my research.

```

> Even without using overhead photos, the upgrade to bitmap graphics will
> be worth the effort!

```

This, I think, is a reasonable statement. I just don't want folks to get too hopeful too fast.

Thanks for the offer Jack, that file is the one which started the ball rolling. I got that one, thanks, was thinking what else can be done with some of the garbage I got here. As a matter of fact I worked for the guy that wrote the file about 5 years ago Dean McDermott WB2CMN, I was a freelance news cameraman for him in the New York Metro area.

Dean was really into the trunking stuff, we had mobiles and portables galore at our disposal and I do know that he was starting a 902 MHz repeater back then I guess that is when he wrote the file.

I got a bunch of 800 MHz Motorola and Standard but no 900 MHz that stuff is few and far between in this area. The FCC for the longest time would not issue 900 licenses unless you were in a area that showed a "need". Miami has shown a need for a while now with their RF saturation but West Palm Beach has been spared, so we do not see that much in the way of old 900 equipment since there are so few licenses. As a matter of fact last month we were contracted by another company for technical support on a new 900 trunking repeater, the first one in our area. That company is way down south from us so they do not want to be bothered with a 2 or so hour drive in case the system goes down. It will probably be quite a few years till we see plenty of these sitting in the corner waiting for "Mr. Sandman".

Well good luck with the 800 MHz radios, hope you can make something happen with them. The mod file for the 900 MHz Maxtracs really caught my attention. They are decent radios and Chuck Hast told me on the ROSE listserver that the Maxtracs make good data radios for 9600. I met a ham/Motorola tech up this way who uses them on 2m and 440 for AFSK and voice, and he loves 'em. They aren't too expensive and you still get the good Motorola quality.

Incidentally, Tom Moulton tells me that he does plan to include some APRS functionality in ROSE. The next release will have the TXUI application which basically allows us to route UI frames through a ROSE network. What you get is an "unconnected" network (sounds familiar, eh? the term itself reminds me of APRS) - this could have some APRS applications all by itself.

Jack

APR REPLY: It means illegal function call. If it is random, usually it comes from a garbled packet that messes up the posit or other field.

## 166. Event Dead Reckoner! (& DX)

From: Bob Bruninga <bruninga@nadn.navy.mil>  
Date: Sun, 8 Oct 1995 23:44:21 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.951001232858.18565D-100000@greatlakes>  
Rendered body type: text/plain

The GOOD NEWS:

In preparations for the upcoming Marine Corps Marathon, I got the initial code for an automatic special event dead-reckoner to work where it will automatically dead reckon special marked objects along an established course. The course is defined by the color purple on an APRS map. All you do is put the lead runner, lead handicpped, lead female, Pack, and tail end charlie on the map, and they will all move right along on schedule AND MAKE TURNS...

THE BAD NEWS: It wont fit. SOMething has got to be left out.

WHAT TO LEAVE OUT? The biggest chunk of code in APRS that NO ONE EVER REPORTS USING is the DX cluster code. Although I am not a DXer and had never used a DX cluster, I found the APRS DX plotting function to be very interesting to watch and even more animated than watching a conventional APRS net. I just dont understand why no one uses it. Or why we cannot get DXers to try it out...

If I take DX out and make it a separate program, then no one will try it... I need some feedback. If you DO use it, tell me. If you DO monitor DX clusters but DO NOT use APRS, then tell me also. I will assume that EVERYONE else just isnt interested in monitoring DX clusters, so NO NEED TO REPLY and clutter my IN-BOX. Thanks,...

Finally, the MC Marathon is on 22 Oct, and dont expect this code to be releasable until after that. If you are going to be doing a "marathon" type event between now and then, and just HAVE TO HAVE this code, lemme know. Otherwise I should be working on smoehting else next week.

Message-ID: <199510090804.BAA13481@acme.sb.west.net>  
Rendered body type: text/plain

Hello Group:

I am in the process of interfacing my Garmin GPS 45 and MFJ 1270B TNC for standalone position reporting. That is, just the TNC and GPS.....no computer.

I would be most appreciative if someone who has successfully done this would send me the particulars of their TNC initialization string. I have the TAPR V1.1.9 Eprom with the NMEA Beaconsing Mode installed in the TNC

and have tried the interface using TAPR's suggested parameters.....that is:

NMEABCN 3 (30 sec), NMEAFLT1 GPGBA, CONMODE CONVERSE, SENDPAC \$0D, and CR ON

When the power to the TNC is cycled on, the TNC sends one position packet immediately and then nothing else. I suspect that there may be some problem related to the Garmin 45 outputting data at a 1 sec rate.....perhaps linefeed or flow conflicts, etc. I have successfully previously interfaced the Garmin 45 to my PC and APRS with no problems, so the GPS port I/O configuration is likely correct, as my position was nicely displayed on a laptop in a mobile configuration while in motion.

I suspect that getting the TNC-2 clone up and running is a matter of selecting the proper initialization string and rather than re-inventing the wheel, I would be grateful for any suggestions from those who have already solved this problem.

Thanks very much.....Jim K60YY

Chip, I tested those incorrect subscribing instructions that someone posted earlier this week. I got a bounced message from the robot, who also told me the address to write if we have problems with the listserver. I have written to that address and outlined the red river problem, asking that it be corrected. I even provided them with the actual bounced message return text.

I also asked that the "reply to" field not be pre-charged with the aprssig@tapr.org address. Maybe it will help some of the accidental sig msgs that should be private.

and by the way- My PC works quite nicely with 1 serial port, a GPS, a TNC, and PacComm's hsp adapter. No PCMCIA card or extra serial port purchase required. Sorry the Mac doesn't support that. :) (just had to get one in, I see so many from Keith about how the Mac does this or that so much better than the PC :) )

Chip

I am using a Pico Packet. Have been since our balloon flight in August. Will be flying it again soon. It isn't vapor ware. It works great. There are at least 4 locally that I know of. The Company posted a message here recently that outlined the status of the Pico. At that time, I think they said they were a little while away from the 2nd serial port option being released to the public. But I think it will be worth the wait.

Wait a minute!!!...

I have already done this in the MacAPRS version. (For those of you who don't know who I am, I am KB2ICI, Keiths twin brother, and I have written

alot of MacAPRS).

I seriously doubt if Bob can do this successfully on his DOS version of APRS because bit map images take up LOTS of memory. A 640 x 480 color (8-bit) bit map image takes up 307K. That is HALF of the limited 640K memory that is available. Even if you use a poor quality color (4-bit) image, its still 150K.

LandSat images are MANY MEGABYTES. I have worked with them and have done lots of manipulation with them. They also are not "square". By this I mean you cannot directly map them to a square x:y lat:lon model. There has to be a LOT of math conversion.

The Mac version ALREADY has the ability to deal with "square" images, i.e. a scanned map or a Delorme screen shot. I do not think this is within the realm of real possibilities for the DOS version.

APR REPLY: Welcome to the first reported use of the TAPR ROM! My guess is that LFIGNORE MUST BE SET TO ON. Without it, each line feed is left in the buffer and with flow control, it prevents the TNC from transmitting. You might also turn off flow control. Not on-the-air flow control, but serial port flow control. Report results to us all.

> rate.....perhaps linefeed or flow conflicts, etc. I have successfully

The above parameters work with my GPS55AVD and look fine (although I used different sentences; 55avd doesn't support GGA) A 1 / second update rate isn't a problem.

The TNC should be RESTARTed after the parameters are emplaced. Do you have regular beaconing or IDing enabled? What are AWLEN and PARITY settings? Is the ASYFRERR and ASYRXOVR counters non-zero?

Despite numerous requests for testers, so far as I know you're the only person besides myself who has used the TAPR NMEA feature after Bob asked me to put it in. As it hasn't been tested in the thousands of possible configs, could be you hit on one that's buggy. Hope not but it could be.

Howie

Jeff,  
Work is supposedly in progress to locate an APRS freq for LA. 145.79 is not it, yet. The SCDCC and whatever-the-vhf-freq-coordinating-group-calls itself-today has been looking at the issue. There is a group that operates 5kHz down from .79 that has to be considered before jumping on .79, in spite of what San Diego has decided. It would be nice if a resonable agreement could be reached that allows us use of .79 while providing the neighbors a solution. You may find out more on the voice packet net in LA, which meets on 145.30 (-600) repeater on Monday at 8PM.

Rendered body type: text/plain

System: 90 mhz Pentium, 16 meg, Stealth 64 bit Graphics  
card.Windows/95.

The F10 key allowed me to switch to other programs while Aprs was suspended.  
When I simply moved APRS to the background (without the F10 key)My graphics would go crazy and the mouse would not respond.

Now I have reduced my colors from 16 million to 256 colors (This is the lowest acceptable number for me and my other programs) .  
I have checked the block on my pif file "suspend while in the background" Now I can easily move between several different programs with no video problems and my mouse works fine. This is a lot easier than using the F10 key. The only problem I get is when my Tnc (PK-232) buffer over fills with incoming data and some data is lost when I return to the APRS program. This is quite acceptable until someone presents a Windows version!

WB4PAN-9 GPS mobile is running and now I will try to tackle some mapping stuff. I foresee another brain overload!! If anyone has some additional unlisted Virginia maps let me know please...

## 188. MFJ TNC to Garmin Interface -- Update 1

From: "L. J. Shepherd" <ljs@west.net>  
Date: Mon, 09 Oct 1995 14:33:06 -0700  
To: aprssig@tapr.org  
Cc: jhobson@west.net  
Message-ID: <199510092136.OAA20178@acme.sb.west.net>  
Rendered body type: text/plain

Hello again Group:

Thanks to all who responded to my earlier request for assistance in interfacing my MFJ 1270 TAPR NMEA ROM equipped TNC to my Garmin 45.

No success as yet, here are the parameters that were changed:

LFIGNORE to ON, FLOW to OFF      no improvement  
CPACTIME to ON, ECHO to OFF      no improvement  
ASYFRERR to 1, ASYRXOVR to 1      no improvement  
BEACON EVERY to 0                  no improvement

Comments:

I also tried a "\$" prefix to the NMEAFLT1 parameter, as NMEAFLT1 \$GPGGA, but it was rejected as too long a command.

I have no documentation regarding ASYFRERR and ASYRXOVR...Howie had suggested they be set to a non-zero value and I arbitrarily used a value of 1. Howie also asked if regular BEACONing was enabled, it was, so I changed it to 0. AWLEN is currently set to 8 and PARITY is set to 0 (4800 baud). When BEACON was turned off, the TNC no longer sends a packet on initialization.....which seems consistent with the parameter description.

Questions:

Is there interaction between NMEABCN and BEACON or ID that should be addressed in the initialization string ? What are the counters ASYFRERR and ASYRXOVR used for ?

I will attempt to append my TNC parameter list (DISPLAY command) to the end of this message.....again, I appreciate all your responses and will welcome further comments and suggestions.

Message-ID: <9510091917.AA46213@lineng.ipc.amex-trs.com>  
Rendered body type: text/plain

I too have had the TAPR code for a while. In fact I received it from Howie last June 94. No problems encountered with testing with several GPS systems. Also tested with WX system.

Most problems that I have helped others solve involve the SEX problems of the RS-232D connectors. ie Is it DCE/DTE and which pin goes where and especially if the interface also includes a DB-9 --> DB-25 connectors.

Later  
Jerry Wyatt

There shouldn't be any. If it refused to work after turning both off then there probably isn't.

? What are the counters ASYFRERR and  
> ASYRXOVR used for ?

ASYFRERR counts on async framing errors, ASYRXOVR counts on SIO overruns. Counts on either of these are Bad Things.

----

Have you tried setting a different sentence in the NMEAFLTx, perhaps GPRMC? The 55AVD doesn't support GGA, maybe the 45 suffers from the same

malady. That isn't completely consistent with your report of it only sending one packet, but it would be if that one packet was really the BTEXT beacon and not a NMEA beacon.

FWIW the NMEABCN mode strips all linefeeds and fills the appropriate buffer (determined by NMEAFL1 and 2) with the most recent sentence. Neither LFIGNORE nor CPACTIME are relevant.

----

A great big thank you to the two gents who posted messages of their earlier success with the TAPR NMEA stuff. I'm extremely happy to hear it is seeing use with the fine line of APRS products.

Exactly several of the points I was trying to make... especially with the Landsat images. We routinely move the 1/2 GIGABYTE files around the office, register them to map coverages and georeference them. No mean feat. And while some bitmaps are doable (load it and flush memory, then go on with the map overlay, flush again, put breadcrumbs down) it's a fair bit of work.

I'm not sure it's gonna happen soon!

Rendered body type: text/plain

YES, I'm using the DX cluster mode and APRS mode.

Yes, the DX cluster mode is animated, and easy to spot trends. But the DX boys mostly do not know of the capability. When I show how APRS can do packet cluster ... they go wow.

However, APRS will not change the freq, mode, etc of the HF radio like MOST DX cluster radio programs do.. lots of folks that are DX cluster users use.

The dead reckoner is a great idea for the Marine Corps Marathon... but thats not a main stream use of APRS.

Kent, KQ4KK

Reply Separator

Subject: [APRSSIG:3755] Event Dead Reckoner! (& DX)

Author: aprssig@tapr.org at postmaster2

Date: 10/8/95 11:59 PM

The GOOD NEWS:

In preparations for the upcoming Marine Corps Marathon, I got the initial code for an automatic special event dead-reckoner to work where it will automatically dead reckon special marked objects along an established course. The course is defined by the color purple on an APRS map. All you do is put the lead runner, lead handicpped, lead female, Pack, and tail end charlie on the map, and they will all move right along on schedule AND MAKE TURNS...

THE BAD NEWS: It wont fit. SOMething has got to be left out.

WHAT TO LEAVE OUT? The biggest chunk of code in APRS that NO ONE EVER REPORTS USING is the DX cluster code. Although I am not a DXer and had never used a DX cluster, I found the APRS DX plotting function to be very interesting to watch and even more animated than watching a conventional APRS net. I just dont understand why no one uses it. Or why we cannot get DXers to try it out...

If I take DX out and make it a separate program, then no one will try it... I need some feedback. If you DO use it, tell me. If you DO monitor DX clusters but DO NOT use APRS, then tell me also. I will assume that EVERYONE else just isnt interested in monitoring DX clusters, so NO NEED TO REPLY and clutter my IN-BOX. Thanks,...

Finally, the MC Marathon is on 22 Oct, and dont expect this code to be releasable until after that. If you are going to be doing a "marathon" type event between now and then, and just HAVE TO HAVE this code, lemme know. Otherwise I should be working on smoehting else next week.

I'm working on something similar here. Let's take this to e-mail for the time being.

A couple of points. Without options A, B and C you won't be able to generate the full SC-104 sentences. You need to have the data for psduorange and pseudorange rate, as well as the corrections, and all the timing data available.

Hello!

I wonder if there is anybody in the SIG who can send me complete details of the RTCM SC-104 data format. I want to build RTCM sentences out of the OUTPUT PSEUDORANGE CORRECTION message of a MOTOROLA PVT6 Receiver.

Thanks.

vy 73 de Mike DL3SDM

The Mac version (MacAPRS) will control the radio and will control some of the antenna controllers to automatically point the antenna in the right direction.

MacAPRS will change the frequency of the Radio, It has been able to do this for a LONG time. I will admit that it isn't obvious, but the stuff is there to do it.. It works with ICOM radios and YAESU radios.

Hello Bob,

Hope you might be able to give me some help. I'm using a old ibm ps2 model 25 to run aprs5.03 the machine has 512k of memory.If i try to run later versions of aprs the machine just gives a out of memory error. So here is my real problem 5.03 seems to run ok but occasionally it crahes and gives me the following error.

```
error number 6
lm,pm:      14      48
a,i,j,k:      2      15
x y x1 y1      297.8686      176.8457      -217.3016      -213.9278
a$
```

Am i doing something wrong in my set-up or is this a error caused by my old computer(512k 8088 micro) ? Any ideas would be greatly appreciated .....

Thanks again for some great software.....

The Video Display card is already bit mapped. Just address it directly and/or  
use a Ram-disk. It is easier with a Win program than with a port of a Mac  
program.

Easy to do with matrix math and the math co-processor or use tensors if you are  
working with an inertial coordinate system such as satellite photos.

It's just this side of REAL difficult with QBasic, but pretty trivial with  
Visual Basic or Visual C. Bob's using QBasic at this point...

> >LandSat images are MANY MEGABYTES. I have worked with them and have done

Well, it depends. Landsat data are UTM-referenced. We have spent quite a bit  
of time registering them to square maps, using software specifically developed  
to do that task, and it's processor and time intensive. It's NOT a  
straightforward transition, even with a SparcStation.

Rendered body type: text/plain

>In Northern California, the APRS frequency is 145.010 MHz.

145.01 is recognized as a keyboard-to-keyboard frequency by the Southern California Digital Communications Committee (SCDCC). Many users are working to get the SCDCC to recognize 145.79 as a APRS frequency. This will come about in time, as 145.79 was previously recognized as a simplex autopatch channel in the LA area.

>  
>Based on this, and that my QTH in So. Ca. is at the 5600' level, I have set

>  
>While this will not address the needs of the stations in the general LA  
>area, those of you that live in "unserved" areas of the lower half of  
>California should take heart that something is available for you in APRS!

This path is very cool news to me in Ridgecrest! But I'd like to mention that we (meaning outside of LA) don't have a problem putting up stuff on 145.79. Since the 145.01 channel is used for keyboard use, and in my area is quite congested as is, I'm putting up a digi on 145.79. I'm hoping to put it on El Paso Peak (where the IYK node resides), which can be heard in the Ca high-desert area. Maybe we can link in the 145.79 to the 145.01 APRS traffic?

I'll see you on 145.01 tonite :-)

Bob,

When using the N key to display wx info for a particular station, is that station's data supposed to be updated in the three-line, blue box at the bottom of the screen?

The top blue box is being updated correctly now. But none of the info in the bottom box lines change when the update appears on top. Maybe it's not supposed to.

Enlighten us.

### 214. Re: [APRSSIG:3740] APRsat

From: dwetzel@acs.uswest.com  
Date: Tue, 10 Oct 1995 17:55:02 -0500  
To: aprssig@tapr.org  
Message-ID: <07af1990@acmspgw1.mnet.uswest.com>  
Rendered body type: text/plain

The objective of the APRsat is to relay very short UI frame packets containing position reports of the form WB4APR>FM19dx-1:\*status\*. These packets contain the Maidenhead Grid Square in the T0 field and result in a very short packet. To do this, all we need is a standard TNC digipeater. The AMSAT APRtrak program will plot these position reports on a map. Beyond these fundamental requirements, here are some other considerations and enhancements:

- 1) Downlink on 2 meters ax.25 1200 baud FM
- 2) Uplink on 2 meters (if possible) else 435
- 3) Use PacComm TNC which has 4 analog telemetry inputs and 2 outputs for basic telemetry.
- 4) No other CPU on board. Hardware reset of TNC at each sunrise.
- 5) Modify TNC code so no digipeater field is used. Digipeat based on the T0-SSID. This would allow for 15 different addressable APRsats on the SAME frequency and save 8 BYTES or 33% of every packet! ALL APRsats would digipeat -0 packets.
- 6) Avoid abuse by modifying TNC to restrict digipeats to POSITs only
- 7) Put a GPS on board to report satellites position.
- 8) Modify the TNC so that it will only DIGI ONE packet per call per orbit
- 9) Modify TNC heard log to include POSIT and interleave previously heard posits from up to 80 minutes prior into downlink so stations can see posits from other side of world (on same orbit)

The biggest problem and earliest one that must be solved is the FREQUENCY PLAN. As an educator, I think that DOVE is one of the BEST investments of the AMSATS due to its simplicity and availability to students worldwide. That is why the APRSat downlink should be on 2 meters. But looking at the difficulty in getting MIR and SAREX frequencies, this may be a problem. As a starter, would it make sense to re-use 145.55? The probability of interfering with MIR or SAREX on that frequency is only around 1 % and if we don't re-use that frequency in SPACE, then the terrestrial packet users will...

-----

How about 145.825 for the downlink and 145.55 for the uplink? No downlink interference for Mir or Sarex, and minimal uplink damage, as Mir is the only 145.55 uplink in use, and that usually only when visible.

Doug  
KC7CO

## 215. Re: [APRSSIG:3796] Re: APRS in So. Ca

From: jkeck@smartlink.net (james keck)  
Date: Tue, 10 Oct 1995 18:37:40 -0700  
To: aprssig@tapr.org  
Message-ID: <199510110136.SAA21759@warp10.smartlink.net>  
Rendered body type: text/plain

The APRS activity in So. CA picked up this past weekend on 145.790. Someone activated a WIDE and from my obscure location in the Northern part of LA Country, I logged a page and a half of APRS locations. I recorded several stations on the East Coast from two in FL to a station in Canada, a few in the Mid-West and even logged Dave in Hawaii. San Diego was well represented with about 10 stations.

So. CA is coming alive. If anyone happened to see either N6HNY or K060N we would sure appreciate hearing about it. Our thanks go to the individual who set up that WIDE digi, it sure helped make an interesting Sunday afternoon.

## 216. Marathon Race

From: jkeck@smartlink.net (james keck)  
Date: Tue, 10 Oct 1995 18:37:42 -0700  
To: aprssig@tapr.org  
Message-ID: <199510110136.SAA21763@warp10.smartlink.net>  
Rendered body type: text/plain

Our local community has undertaken a major project, in that they are planning to sponsor and hold a full Marathon Run on November 12th. You guessed it, our local radio club has been asked to provide some of the communications support for the event. Some of the thoughts centered around APRS and how it could be best used to provide timely information.

I would appreciate any information that any of you might provide who have done that and been there. We have barely been able to scratch the surface in using APRS to its full extent (ref: SoCA Activity msgs) here in Southern CA.

If anyone has some compact sending units that we might borrow for the event, we would be indebted to you and greatly appreciate your assistance. Rest assured that any equipment would be well taken care of while in my possession.

Please respond direct rather than taking up SIG space for individual replies.

If anyone lives close enough and wants to personally provide some direct support on this project, please mention that in your reply. This Marathon will be held in the Santa Clarita Valley, Northern LA County, near the Magic Mountain Amusement Park.

The Race Director plans to start the event at 0700 and conclude it by 1400 or the runners become spectators. The lead vehicle may be a motorcycle as some parts of the course are not on city streets.

Thanks in advance if I am unable to respond directly to all of you who send along your comments and suggestions.

73, Jim Keck, N6HNY

## 219. MFJ TNC with TAPR GPS EPROM to Garmin 45 Interface -- Update 2

From: "L. J. Shepherd" <ljs@west.net>  
Date: Tue, 10 Oct 1995 19:49:20 -0700  
To: aprssig@tapr.org  
Message-ID: <199510110252.TAA25010@acme.sb.west.net>  
Rendered body type: text/plain

Hello Group:

Many thanks to all who responded, including Bob, Howie, Rich, Ted, Ralph and several others. The problem is solved.....and the TAPR 1.1.9 EPROM in my MFJ 1270B

is now nicely controlling in the NMEABCN mode.

I must admit that I fell prey to the old DCE/DTE trap.....one of you kind gentlemen suggested that I double-check DCE/DTE, which I did, and immediately saw my error. I quickly installed my trusty null-modem adapter and my system promptly began to beacon position packets !

Here are some of the final parameter settings that I used with the MFJ1270B and the GARMIN GPS45, in the interest of providing some feedback to all who might be interested in using the TAPR 1.1.9 EPROM in their TNC-2's:

NMEABCN 3, NMEAFLT1 GPGBA, CONMODE CONVERSE, SENDPAC \$0D, CR ON, LFIGNORE OFF  
FLOW ON, CPACTIME OFF, ECHO ON, BEACON EVERY 0

In my system the first position beacon now occurs 30 seconds after power-on and thereafter at the selected 30 sec (NMEABCN 3) interval. As a point of information, enabling the 'normal' TNC BEACON results in the transmission of a beacon packet immediately at power-on. This BEACON packet is not to be confused with the NMEABCN packets containing the GPS-derived position data. Once NMEABCN is enabled, the TNC will beacon at power-on after the selected interval without the need for any computer input or other reset commands.

Thanks again to all who so kindly responded.....73, Jim K6OYY  
TAPR 502

It would be nice if there was a generic gateway name such as VGATE? for a gateway between two vhf frequencies such as 145.01 and 145.79. We are going to put a local node on 145.79 here in Amarillo, TX in the near future, but why try to rebuild the 01 network on 79 in sparsely populated areas around the city to let mobiles get in from outlying areas? Any ideas on this.

## 221. Re: [APRSSIG:3808] MFJ TNC with TAPR GPS EPROM to Garmin 45 Interface -- Update 2

From: John Hobson <jhobson@west.net>  
Date: Tue, 10 Oct 1995 22:54:31 -0700  
To: aprssig@tapr.org  
Message-ID: <199510110554.WAA05688@acme.sb.west.net>  
Rendered body type: text/plain

Hello APRSsig:

With the help of fellow Santa Barbarian, K6OYY, I've completed mating the Garmin GPS45 with the AEA PK-12 for stand-alone tracking use in a vehicle (without a computer running APRS). I learned the following things with OYY's help and trial and error.

1. The interface between the GPS-45 and PK-12 requires only two connections

|          |                |               |                                 |
|----------|----------------|---------------|---------------------------------|
| GPS45    | *              | PK-12 (DB-25) |                                 |
| Data Out | --brown----    | Pin 2         | * wire color on Garmin supplied |
| Ground   | -----black---- | Pin 7         | cable-plug assembly.            |

2. A good source of power for the GPS-45 is via the PK-12. On the underside of the PK-12 circuit board, tie together the pad of DB-25 pin 9 or 11 and the nearby large pad of the center pin of the power jack with approximately 20mm of insulated wire.

Then, add:

|       |              |               |  |
|-------|--------------|---------------|--|
| GPS45 | *            | PK-12 (DB-25) |  |
| Power | -----red---- | Pin 9 or 11   |  |

This will provide 12 unswitched volts to the GPS45 when the PK-12 is plugged into its 12 v source.

3. I have had some trouble with the PK-12 forgetting the commands input into it from the computer. The procedure is to attach the PK-12 to the computer via a serial port and issue the commands to prepare the PK-12 for stand alone use. Then, switch the pk-12 off, disconnect it from the power, and transfer it to the vehicle, applying vehicle power. My PK-12 is jumpered correctly for the Li battery to maintain the memory, however on many occasions, between the shack and the car, the PK-12 has forgotten what has been input. Removing and re-applying (rocking?) the jumper (JP 1) seems to have helped this problem.

With this exception, the mating of these two pieces of equipment seems to be straight-forward.

The only high level digipeater here in SB is 145.05 on La Cumbre Peak. K60YY and

I have been tracking each other on this machine with some success.

Regards and thanks for your postings on APRSsig.

Rendered body type: text/plain

Hello, Bob just installed version aprs73a, I am having problems with using with my aea pk232 tnc. I read the readme text, and seems as thou I configured the tnc as requested. but I can't receive any packet burst to show other aprs stations that I know are sending packet burst back, they are receiving my burst ok, but all I get in the red box on the bottom of my screen on aprs is scrambled text and characters. when I connect to a friend of mine using aprs also. My aea goes into conv/error mode when accessed by your program. and when I quit the aprs it resets my tnc back ok to other commands that were previously set. tnc is working ok on dumb terminal also. any help would be appreciated, will be sending in registration fee shortly. Thank You  
signed, Dan Roy kalbno.

## 225. Re: [APRSSIG:3808] MFJ TNC with TAPR GPS EPROM to Garmin 45

From: dwetzel@acs.uswest.com  
Date: Wed, 11 Oct 1995 10:04:24 -0500  
To: aprssig@tapr.org  
Message-ID: <07bd4c10@acmspgw1.mnet.uswest.com>  
Rendered body type: text/plain

Hello Group:

Many thanks to all who responded, including Bob, Howie, Rich, Ted, Ralph and several others. The problem is solved.....and the TAPR 1.1.9 EPROM in my MFJ 1270B is now nicely controlling in the NMEABCN mode.

I must admit that I fell prey to the old DCE/DTE trap.....one of you kind gentlemen suggested that I double-check DCE/DTE, which I did, and immediately saw my error. I quickly installed my trusty null-modem adapter and my system promptly began to beacon position packets !

Here are some of the final parameter settings that I used with the MFJ1270B and the GARMIN GPS45, in the interest of providing some feedback to all who might be interested in using the TAPR 1.1.9 EPROM in their TNC-2's:

NMEABCN 3, NMEAFLT1 GPGBA, CONMODE CONVERSE, SENDPAC \$0D, CR ON, LFIGNORE OFF  
FLOW ON, CPACTIME OFF, ECHO ON, BEACON EVERY 0

In my system the first position beacon now occurs 30 seconds after power-on and thereafter at the selected 30 sec (NMEABCN 3) interval. As a point of information, enabling the 'normal' TNC BEACON results in the transmission of a beacon packet immediately at power-on. This BEACON packet is not to be confused with the NMEABCN packets containing the GPS-derived position data. Once NMEABCN is enabled, the TNC will beacon at power-on after the selected interval without the need for any computer input or other reset commands.

Thanks again to all who so kindly responded.....73, Jim K6OYY  
TAPR 502

The KPC-2 is only a single port unit.

Their (Kantronics) KPC-4 (which you were probably thinking of) has 2 1200 baud ports, as I recall.

It could also be done on the Dataengine, when two 1200 baud modems are installed. Or on the other dual port boxes from AEA.

Another solution, would be to have APRS address two TNC ports, (I can hear the crying now: "Where do I connect the mouse to!?", "How come it don't support weird IRQ's") and of course operators have to make sure that if they gate in the same band, they isolate the radios from each other (filters, vertical antenna spacing, etc.), so that they don't QRM each other out.

Barbara,

Do you know how to program a Mac? Do you know how to program Windows?  
Well, I make my living programming the Mac but I know how to program  
Windows as well. And for the most part, they are very similar. When  
programing graphics on Windows, IF you do it the right way, then it is  
ALMOST identical to the way that it is done on the Mac.

Many Windows/DOS programers write directly to the video screen, while this  
works in some case, it is NOT the right way to do it. It is also why so  
many of the DOS/Windows programs are so picky and dont run if you dont have  
EXACTLY what the program is expection (normally 640 x 480 by 16 color)

Thanks Garry for backing me up on this point. One of the points that Bob  
keeps bringing up over and over again is "Yes, but APRS will still run on  
an 8088 lap top". If we want to have some of these new features, at some  
point we have to say, "Sorry, this version needs a cpu of at least x

caliber"

Rendered body type: text/plain

Just to keep you a breast of happenings, I got BETA version number 2 of KB4XF's latest ONE STEP mapmaking program for the 100K maps. It automatically decides what level of detail to extract depending on wheter you ask for an 8, 4 or 2 mile map!

Just extract the USGS files for your area, run the program, and come back in a half hour or so, and your map is done...

BUT, I SENT IT BACK TO HIM, cuz it generates perfect maps, but they are offset from the real world by distances of 1/4 to 1/2 mile depending on range.... So to let even a BETA test copy out would be a nightmare...

No need to comment, ill let you all know as soon as he fixes this remaining bug.

DE WB4APR in Annapolis MD. (Not anywhere near Greatlakes)

I was thinking, shouldn't be but I was, of two or more tnc's running X-1J NETROM. As I understand it you can do two with a serial cable between them and more than two using a diode matrix? It would save us and I'm sure others from having to completely rebuild the outlying network, but allow us to keep the majority of the traffic of the busy channels. Although some in the area like it on the regular channels and say we (those of us running APRS' in the area) should take over all the packet freqs here due to the fact we have put a new spark into packet radio. Appreciate the program Bob.  
It may be avantagous to be able to link more than two tnc's to get back on 79 as our northern network is on 01 and the southern one is on 09. Should only need one VHF alias due to the traffic only going from 01 and/or 09 to 79. There should be very little traffic going back to 01 or 09 from 79. Bye keeping it APRS specific it would keep the BBS's off of 79 and keep most APRS off the others.

-----  
It would be easily accomplished by using a KPC-4. It works exactly like a KAM except that both ports  
are 1200 baud. So all you need to do is put one port on .01 and the other on .79 and set MYGATE VGATE.  
I used to own a KPC-4, but sold it about a year ago... now I wish I had it back!

Larry

Bob sez maybe the KPC-2 for dual VHF ports ?

Not the KPC-2 but the KPC-4 for dual VHF ports, this will work very well as a cross frequency or VHF/UHF cross band digi. The KPC-2 is the older version of the KPC-3 concept whereas the KPC-4 is similar to the KAM, but is dual VHF ports...

Unfortunately, you'll have to get it direct from TAPR, they don't just give that code away anymore. It's about \$15.00 for members + you get the big manual of commands.

The KPC-4 sounds like a good idea, as I can't really put a PC on the hilltop running APRS. The other option of putting TheNet EPROMs is better in my case, as I could then connect to the existing 145.01 NETROM node on the hilltop. The next question: Can you digi thru a NETROM node stack, meaning digi from the 145.01 out to the 145.79 node? Of course, you can connect thru the stack with the NETROM protocol or by connecting manually to each node in turn, but I've never tried to digi...

## 238. Motorola PVT-6 Program ?

From: mark@tetherless.com (Mark Oppenheim)  
Date: Thu, 12 Oct 1995 13:59:06 -0700  
To: aprssig@tapr.org  
Message-ID: <199510122059.NAA00862@gorgor.pa.tetherless.com>  
Rendered body type: text/plain

Does anyone know how to get the PVT6 GPS out of the Motorola Binary format and output NMEA strings?

As I recall, there is a web page with a number of programs on it (primarily for the Garmin) but it also contained a Motorola PVT-6 initialization program.

Thanks!

Mark

## 239. Re: [APRSSIG:3819] Re: APRS in So. Ca

From: Bob Bruninga <bruninga@nadn.navy.mil>  
Date: Thu, 12 Oct 1995 17:23:43 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.951012171253.3448A-100000@greatlakes>  
Rendered body type: text/plain

The ONLY reason for suggesting 145.79 as a standard frequency is so that mobiles can put XTAL controlled Stand Alone Trackers in their Trunks and go anywhere without having to change freqs.

Considering that objective, there may be a half-way solution for areas that have conflicts on 145.79. Have your HIGH SITE WIDE DIGIS listen on 145.79 but OUTPUT on any other freq that you can get coordinated.

Mobiles only have a range of a few miles to other stations, so they probably will not bother existing users even 5% of what a WIDE DIGI OUTPUTING on 145.79 would.

DOWNSIDE: The downside probably out weights any advantages tho:  
1) Doesnt help visitors find teh OUTPUT freq to monitor

- 2) Requires everyone to operate DUPLEX
- 3) YOU LOOSE CARRIER DETECT COLLISION AVOIDANCE
- 4) You cannot go DIGI to DIGI without requiring dual receivers and dual transmitters,
- 5) etc, etc

So the only reason I suggested this, is that even in areas which have chosen alternate frequencies, it wont HURT them, nor create any TURF wars if you also add a 145.79 RECEIVER at your WIDE site, so that wandering mobiles will show up in your net..... Remember, they are on the ground, and hardly ANYONE will hear them direct...

Just a thought....

Here's the line copied from my hypercard stack for dealing with the PVT-6:  
sendSPort "@@Ci" & numtochar(1) & numtochar(43) & crlf

The command is "@@Ci" followed by a binary 1 for NMEA mode, the message checksum, and a cf/lf pair.

The corresponding command to go from NMEA to Moto proprietary mode is:  
\$PMOTG,F0R,0

Remember that you also have to switch baud rates, so it's a \*good idea\* to wait for the transmit data buffer to go completely empty, and then switch baud rates on your port.

Hello Mark..and others,

There is a APRS program in the main dir that is called MOTOROLA.BAS that does this. Bob wrote it for CAP for that purpose. If it's not in the latest version, Bob or myself can send you a copy.

Later

```

Bob-

Thanks for the info! I did try the \$PMOTG,FOR,1 string, but it did not seem  
 to work, however (the disclaimers follow):

1. I only have a few pages of the manual
2. I don't know the baud rate/parameters of the Motorola format (which is probably my problem)

I DID find the GPS90 program from motorola on the Net, but little documentation, as to what all the function keys do.. At least I know that it's "alive" (still waiting for a almanac, though) and in the Motorola format, as I suspected.

As I want to use this with APRS, I was wondering if the NMEA (which is usually at 4800 baud by default - or specification) could be set to 1200 baud - since I have an OLD PacComm unit (pre-micro/handi/packet) that will only communicate on the serial port at 1200 baud. I then have to burn the TAPR 1.1.9 code onto a PLCC chip :(

Garmin 45 guru.

I've been using the 45 stand-alone for a month just to read lat & lon in  
northwestern Pennsylvania, not connected to a computer or TNC. For the past  
four or five days or so I have not been able to acquire enough satellites to  
get a lat-lon reading. Most times it acquires only one satellite. It appears  
to have stopped working. (The battery level is at least half to  
three-quarters.)

I'll use this evening, Thursday, 10/12, 8:30 p.m., as an example. When I  
turned it on in an open area, the initial screen showed seven satellites.  
Within a minute or two, satellite number 14 acquired and showed a signal

strength reaching about the fourth line on the scale of five lines.

Then over the next five minutes all the other satellites disappeared, and that's the way the screen stayed until I turned it off about five minutes later. Just number 14 was there, good and strong. Where'd all the others go?

Is anybody else having this problem? What am I doing wrong? How can I get this beast to resume functioning?

The last time I got strange satellite problems just happened to coincide with the military firing missiles into Bosnia, or wherever they were firing the missiles in anger. So then I just assumed the government monkeyed with the satellites causing the Garmin to act silly. Did anybody else notice that?

If anybody can help, I would appreciate some guidance.

I have another puzzle . . . and I've got big money riding on this one. How do you pronounce Garmin? With a G sound as in Garment or with a J sound as in Jar? I say Garmin's G is as in Garment. Dave, N3EOY, says J as in Jar, therefore Jarmin. If I'm right he has to buy the coffee. Who buys?

TNX & 73,

Tony, WB3KGT

Hi Gary,

We had the same problem only with 11 Garmin 45. I forget what version the software was but we (Pierce County Search & Rescue) had them for about a year and they just kept getting worse and worse.

I called Garmin and they gave me a return authorization number for one of them. As soon as they got it they sent me a new one and had me send the other 10. All were replaced with brand new units. Unfortunately, they were stolen a few nights ago out of one of our members van. Also got his Electric wheelchair and all his ham gear.

Anyway, I think there is a problem with some of the early firmware but cannot get Garmin to own up to anything. You should give them a call and ask them for a return authorization number. More than likely you will get a brand new Garmin - 45 that works better than the original ever did...

Good Luck

Tony-

I have 2 Garmin 45's here at work.

The longer that they are turned off (or acquired a good fix) the longer it  
will take to acquire a new set of satellites. This is exacerbated if it is  
turned on inside a building, and it does not "see" the satellites it  
expects. It then seems to go into another mode altogether. Getting signal  
strenght does not indicate that you are reviewing good data - or a "almanac"  
from that satellite, so it's not the whole story.

Put it in the "Search Sky" mode, and let it find the satellites. Sometimes  
this can take up to 25 minutes - especially if moving. There are times when  
you just don't have enough good satellites (high enough up in elevation) to  
get a good fix. You can enter this mode on power-up by holding down the  
power button and the PAGE key.

I have seen some strange (can't lock) problems during some unusual events  
(like the UN celebration in SFO a few months back) but there's always  
SOMETHING strange going on in the world... you haven't exposed the Garmin to  
high RF fields when on, have you?

On the pronunciation, it's "GARMIN" as in "GAR-BAGE" (call the tech support  
and find out). Although, don't settle for just coffee with Dave. Have him  
do the complete Ethiopian Coffee Ceremony. He knows how this is done - I  
was there when it was performed for him in Sudan, so don't let him weasel  
out of it!

Mark

>  
> 73, jan  
> kc6uth  
>

Jan the simple answer is YES YOU CAN. Although I haven't tried it with x1j nodes running wide as an extra alias in both it should be possible. What you will need to do though is add the Wide alias in to the node table for each opposing node running the alias.

Example; W8XYZ-1 alias:test DXCluster alias; WIDE  
W9XYZ-2 alias;temp DXCluster alias; WIDE

Both nodes are in the same stack together.

node table for W8XYZ-1;

N W9XYZ-2 + WIDE 120 7 1 W9XYZ-2

node entry for W9XYZ-2;

N W8XYZ-1 + WIDE 120 7 1 W8XYZ-1

Then make sure that digipeat is enabled on both ports. The nodes should cross port the digi signal. You may need to add and callsign other than the nodes call for each extra alias, in which case just substitute the calls. I haven't tested this exact process using the extra aliases but I do use this method quite often to cross connect to nodes in a stack that are told not to talk to each other.

Let me know how it goes, I have been thinking about doing the same thing here.

Barbara,

Do you know how to program a Mac? Do you know how to program Windows? Well, I make my living programming the Mac but I know how to program Windows as well. And for the most part, they are very similar. When programing graphics on Windows, IF you do it the right way, then it is ALMOST identical to the way that it is done on the Mac.

----- End Original Text -----

That's a bit excessive Mark, I think we should ask Barbara what she has in mind, what do you have to fear ?

Regards  
Don Agro, VE3VRW

Dog Park Software Ltd.

P.S. I have a retail Mac program out there with over a million users and I'd like to hear a little more about her ideas on Tensors.

Hi Tony,

The sci.geo.satellite-nav newsgroup has had several posting from people describing the same behavior (of losing satellites over time). Several of them have sent the units back for service, with some success.

I think it's Garmin, as in Garfield.

The basic code that will do that is included with the APRS package. It's call `Motorola.bas` and works great. I use it all the time and with a simple terminal program like `LYNC` you can monitor the NMEA strings timings if you set up multiple string types.

## 255. Reporting Hurricane or Tropical Depression

From: "Charles W. Davidson" <cdavidso@hemisphere.neocomm.net>  
Date: Fri, 13 Oct 1995 07:39:56 +0000  
To: aprssig@tapr.org  
Message-ID: <199510131138.HAA01282@hemisphere.neocomm.net>  
Rendered body type: text/plain

When Roxanne was downgraded to a tropical depression I could not decide which object to use. Should I still select hurricane from the objects menu? I expected the object to change to blue for a Tropical Depression. I used /TD/ in the comment field instead of /HC/ and also reported 000>175 in the radius field to show no hurricane force winds but 175 radius of Tropical winds. Should I have selected Tstorm for the object ?

## 256. Re Reporting Hurricanes vs. Tropical Depressions

From: "Charles W. Davidson" <cdavidso@hemisphere.neocomm.net>  
Date: Fri, 13 Oct 1995 07:58:30 +0000  
To: aprssig@tapr.org  
Message-ID: <199510131156.HAA01556@hemisphere.neocomm.net>  
Rendered body type: text/plain

Ok I found the problem I created. The reason APRS did not show the difference in (TD) and (HC) was, I added and extra ( / ) in the comment field.

I originally put:       /TD/050^060/993>000&140

I should have put:       TD/050^060/993>000&140   The coment field  
provides the first (/) slanted line.

After doing this correctly the icon for the storm turned blue to  
show a tropical depression.

## 257. Re: [APRSSIG:3832] Re: Motorola PVT-6 Program ?

From: jra@ag9v.ampr.org

Date: Fri, 13 Oct 1995 08:01:16 -0400 (EDT)

To: aprssig@tapr.org

Message-ID: <199510131201.IAA11550@ag9v.ampr.org>

Rendered body type: text/plain

I just acquired a PVT-6 and have gone through some of this frustration.  
The Motorola software is pretty much useless without at least the "Quick  
Start" command reference, as all the setup stuff is done with commands  
and not function keys -- all the fkeys do is show different status displays.  
To switch from Motorola binary format to NMEA, you enter "ioformat nmea"  
from the command prompt within the program. You can also go to a loran  
emulation mode with the command "ioformat loran." There's also a mode command  
that switches between "idle" and "position fix" modes -- make sure you're  
in fix mode!!!

The baud rates are hard wired -- 4800 for NMEA and 1200 for Loran.

And here's the real trick -- once you get into NMEA mode, you need to send  
NMEA command strings to turn the output on and set the rate for each  
sentence! The format is:

\$PMOTG,<sentence name>,<rep rate in seconds><CR><LF>

So \$PMOTG,GGA,0001<CR><LF> sets the GGA sentence to output once per second.

The hangup I had was getting my comm program to output <CR><LF> with the  
return key -- that's not Procomm's default. It's also helpful to toggle  
half-duplex mode so you can see what you're typing, as the PVT-6 doesn't  
echo characters.

73,  
John

Message-ID: <07e6ba90@acmspgw1.mnet.uswest.com>  
Rendered body type: text/plain

The ONLY reason for suggesting 145.79 as a standard frequency is so that  
mobiles can put XTAL controlled Stand Alone Trackers in their Trunks and  
go anywhere without having to change freqs.

Considering that objective, there may be a half-way solution for areas  
that have conflicts on 145.79. Have your HIGH SITE WIDE DIGIS listen on  
145.79 but OUTPUT on any other freq that you can get coordinated.

Mobiles only have a range of a few miles to other stations, so they  
probably will not bother existing users even 5% of what a WIDE DIGI  
OUTPUTING on 145.79 would.

DOWNSIDE: The downside probably out weights any advantages tho:

- 1) Doesnt help visitors find teh OUTPUT freq to monitor
- 2) Requires everyone to operate DUPLEX
- 3) YOU LOOSE CARRIER DETECT COLLISION AVOIDANCE
- 4) You cannot go DIGI to DIGI without requiring dual receivers and dual  
transmitters,
- 5) etc, etc

So the only reason I suggested this, is that even in areas which have  
chosen alternate frequencies, it wont HURT them, nor create any TURF wars  
if you also add a 145.79 RECEIVER at your WIDE site, so that wandering  
mobiles will show up in your net..... Remember, they are on the ground,  
and hardly ANYONE will hear them direct...

Just a thought....

APR REPLY: You could use >000&175 for hurricane winds out 000 and TS  
winds out 175. Or you could drop the >000 and just used &175 to get the  
tropical storm radius. But since it is a DEPRESSION, then neither of  
these fields is exactly correct. But if they specify a radius, you can  
still use these fields to draw a RED or a YELLOW radius circle.

Just saw the ad in November QST, page 203 bottom right...

The Peet Bros have delivered on their promise and are offering a new  
weather station with more bells and whistles... things we've been waiting on  
here in South Jersey... costs \$379 plus extra for humidity, dew pt, and of  
course, rainfall.

Hey Bob... you may need some extra characters in the comments field, eh?

I called the 800-USA-PEET (800-872-7338) and asked for a brochure and found  
that there will also be available in November a Ultimeater-500 which won't  
have  
as many bells and whistles as the 2000 but more than the current U-II.

The following things are already supported in the APRS text strings..

Hxxx for humidity  
Bxxxx for pressure (we had a large discussion about this awhile back)  
Gxxx For wind Gust.

This stuff was added in preparation for the new Peet Bros units.

I already have the full documentation to the unit and it looks quite good..

We got to see one of these at the New Jersey ARRL Convention/Hamfest last weekend.

The also showed a REMOTE MOUNT (RF) linked Rain gauge for remote sites, i.e. out in the yard someplace away from trees etc..

Good Work Peet Bros!

## 269. MFJ DATA RADIO

From: Bob Bruninga <bruninga@nadn.navy.mil>  
Date: Fri, 13 Oct 1995 20:22:56 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.951013201829.18942D-100000@greatlakes>  
Rendered body type: text/plain

I'm still feeling good about my purchase of the MFJ 5 watt data radio. Hooked it up tonight, and it works right-outta-tha-box. But of course, I always want to push the envelope a little bit. Here is what I sent to MFJ:

I was going to use it as dual speed both 1200 and 9600 baud with the dual port dual speed KANTORINCS 9612 TNC. The problem is that MFJ provided NO schematic so I can see where to hook up BOTH 1200 and 9600 simultaneously. Their JUMPER description does not help, because I want to select BOTH simultaneously.

So far it looks like a great little radio. Here are some suggestions for the next revision:

- 1) ALL TNC's require the proper adjustment of RECEIVE audio to be done AT THE RECEIVER. NO TNC's provide RECEIVER VOLUME ADJUST. Therefore your RADIO should provide a receiver level adjust.
- 2) With almost all TNC's being low power these days, please add a JUMPER for sending out 12 volts on the unused TNC connector, pin 5. But this is lower priority and should not conflict with #3 below.
- 3) ALLOW FOR SIMULTANEOUS OPERATION OF THE RADIO IN BOTH 1200 and 9600 baud modes. This is easy to do. Leave the existing BANDWIDTH and MODULATOR JUMPERS in place and wired AS-IS to the lower 5 pins of the standard 5 pin DIN PIN-OUT. BUT USE AN 8 PIN DIN CONNECTOR ON YOUR BACK PANEL. (A 5 pin DIN plug will still work for everyone doing single speed operation and the function of your jumpers still works as published). THEN wire two of the additional pins to provide simultaneous access to the VARACTOR MODULATOR and unfiltered receive audio for the 9600 baud bandwidth.

This permits the DATARADIO to work with the dualport/dual speed KPC-9612 at the same time. THIS IS AN IDEAL WAY to provide the transition to 9600 baud.

Charles, Peter (W7LUS) and I provide all tropical disturbance reports on the HF side of APRS and we use the same convention as the NWS and change the symbol according to strength...so, yes, when Roxanne was downgraded to a T.S., you use the T.S. symbol. Too bad you don't have an HF Gate nearby, then all you would have to do is uplink the object to the local VHF net.

73 and happy APRSing

>

Re: The above problem

On the PK-12 the last command you issue to the TNC is to go in to GPS mode.

If I remember correctly, the last message to come up is a warning that the baud rate will be changed to 4800 baud and to press any key etc...

If you don't hit enter, it won't go into GPS mode. I learned this the hard way, as I had programmed it...took it out to the car... and it won't work. The end result is it comes up in command mode.

Hope this helps...mike

## 273. F10 Doz key...

From: "David G. Henderson" <daveh@moose.erie.net>  
Date: Sat, 14 Oct 1995 10:54:08 -0300  
To: aprssig@tapr.org  
Message-ID: <m0t47yP-000fzdC@moose.erie.net>  
Rendered body type: text/plain

Bob,

I have been testing the F10 Doz key here under high resolution video Windows for Workgroups 3.11.

Over several days there were no problems--hit the F10 key switch away to do something else and switch back, then hit space bar to repaint screen. This does solve the problem of the video trying to access the screen in the background.

But I think that you must have missed a subroutine. Something (very infrequently) is still trying to get to the screen even after the Doz key is pressed. It MIGHT be when a station tries to connect and APRS tries to switch to the blue screen.

I suspect this because when the program bombed this morning and I rebooted it, the TNC buffer was holding connect and disconnect statements from a particular station to my station.

Could you check this. I think that the addition of the Doz key is doing the job for those of us who are too lazy to change video modes while running APRS under Windows. This is a good work around until WinAPRS is born.

73, keep up the good work

Dave, N3EOY

Rendered body type: text/plain

Hi Bob,

I have been running APRS under Windows 95 since the Release. I have had no trouble with it at all except the BEEPS. I need to run Beeps off to tolerate being in the same room with the 'Puter if I don't

I wonder if there is any way to tell APRS that its in the background and not beep?

Wonder if anyone is having trouble with this?

## 275. Problem in 73d?

From: Jeff Ward <jward@marlin.gulf.net>  
Date: Sat, 14 Oct 1995 10:24:37 -0500 (CDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.BSI.3.90.951014101944.11711A-100000@marlin.gulf.net>  
Rendered body type: text/plain

The other night I was using version 73d, carrying on a local conversation with another ham here on VHF. When I had multiple lines of text (using the S command) that were waiting to be acked, those lines were being transmitted as many as 19 or 20 times each at each transmission! The more un-acked lines there were, the more the lines were repeated. Has anybody else had similar problems with 73d, or is this something stupid that I did? I've never had this problem with earlier versions.

Rendered body type: text/plain

Hello,  
I have had VERY good luck running APRS under WIN95. I moved the APRS Executable program to the STARTUP Section of the toolbar so if power fails it can get running again without human intervention.

After moving it to the Startup section, the only thing I changed was to give it a little less Idle Sensitivity so Windows will keep some of the Resources to APRS a little longer. Other than that, nothing was changed.

I am running on a Pentium 60. / With 16Meg of RAM. HOWEVER, I have run the same setup in a 486dx/66 and 8Meg.

Only thing I have a problem with is the BEEPS. They are ten times as long. Everything else is PERFECT!

I noticed an inordinate (as many as 30 ) number of acks from a station  
the other night, I blamed him for having too many WIDES and a band  
opening, and the fact that I was using the single hop of RELAY. But now  
I am suspicious considering the following message. SO if any one can  
nail this one down for me, lemme know!

Hi Gary,

We had the same problem only with 11 Garmin 45. I forget what version the software was but we (Pierce County Search & Rescue) had them for about a year and they just kept getting worse and worse.

I called Garmin and they gave me a return authorization number for one of them. As soon as they got it they sent me a new one and had me send the other 10. All were replaced with brand new units. Unfortunately, they were stolen a few nights ago out of one of our members van. Also got his Electric wheelchair and all his ham gear.

Anyway, I think there is a problem with some of the early firmware but cannot get Garmin to own up to anything. You should give them a call and ask them for a return authorization number. More than likely you will get a brand new Garmin - 45 that works better than the original ever did...

Good Luck

For use in an AIRPLANE, do NOT get the Garmin.. My recommendation would be the Eagle Acunave Sport.. It is a little more expensive, but is a very nice unit, and does work at higher speeds..

Get it at any boat store.. or marine mail-order place..

Keith

Any GPS with a NEMA output "should" work. I have been using a Garmin 95 with a Paccomm Handi Packet and am pleased with the combination. Note that you must not use Garmin's route function if you want to run in GPS stand-alone beacon mode because it transmits \s and these are interpreted by the Handipacket as a command to escape from GPS mode and get back to being a normal TNC.

The Garmin 90 is a cheaper aviation model that has received good reviews. Many of my soaring friends like the Eagle (which is

cheaper still, but doesn't have the neat airspace stuff in it).  
I have used neither with APRS.

Also note that some of the cheap GPS models (including Garmin's) are made brain-dead by the manufacturer above 99 knots. These are not very useful for aircraft.

An issue with any TNC in an aircraft is the TNC interferring with the aircraft radio (or a 2 meter handi-talkie for that matter).  
I have had less problems with the Handi Packet than with a PK-12, but that may be installation dependent.

Where to buy? These are available from various catalogues.  
I bought mine from a local aviation electronics shop after negotiating a discount. Not as cheap, but they loaned me a unit to try out before I bought it and took the first one back no questions asked when it died after a couple of weeks.

I have had good luck with Garmin support. After a friend borrowed my model 95 and twisted the BNC connector off (very hard to do), Garmin fixed it free even though it was not in warranty.

Mike, KT7D

Message-ID: <199510152215.RAA16604@flowbee.interaccess.com>  
Rendered body type: text/plain

Hello all,

Ive put off several messages to the SIG these past few weeks so I thought Id post them together and let you sort them out.<grin>

### APRS DOS LapTop

I've picked up a new (dealer old stock) ACER model V486S laptop for APRS Mobile use, 486sx25, 4 meg ram, and TWO SERIAL PORTS!! Boy is it slick not having to worry about HSP stuff it also has a bus (PS2) mouse port and a PC card slot, I'm running Windoze95 on it and APRS is working fine in background, if you mobile guys come across one it maybe worth your while to try it out. Now if I can just figure a way to power it from 12V,,,,,,

### STAND A LONE TRACKER

Dave KA9NHL and I put a Motorola card into a TINY2 case running the antenna line out the back and doing the wire stuff internally. Set up the paramaters turned it on and its working fine. Its a tight fit, and I dont know about heat build up yet but so far so good. If you want to program the GPS I use a NULL-MODEM adapter, to talk to the TNC a serial cable works fine. I let you know what happens and if anyone is interested Ill post the wire hookups.

### HSP PC board

FAR circuits has sent me a few finished HSP boards and they look great. Its made to be inserted between the pin rows on a DB9 connector. Its well marked and component installs should be a snap. Im mailing one to Bob so he can tell us what he thinks. If you all cant wait you can buy them for \$3.00 each + \$1.50 postage or 10 or more at \$1.25 prepaid ( gee whats the better deal?). Contact FAR CIRCUITS, Fred Reimers, KF9GX, 18N640 Field Court, Dundee, Illinois,60118. (708) 426-2431.

### Northern Illinois APRS Network (NIAN)

Dan N9XHP has put together a GREAT newsletter and Ill be posting a copy on the FTP site soon , take a look at it. If anyone else is doing something similar lets start an exchange.

### 293. APRS Symbols on mobile trackers

From: Tom Kinahan <kinahan@mail1.bytex.network.com>  
Date: Mon, 16 Oct 1995 09:50:25 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.951016093325.18409B-100000@ws007-fddi>  
Rendered body type: text/plain

I've been reading the README files more closely lately, and came across an Item I thought useful and interesting. In Symbols.txt, the file indicates that mobile trackers (stations with GPS, TNC, Radio no computer) can change how they are displayed on APRS screens by one of two ways.

First, it says is by the stations SSID and second by putting a character in brackets at the beginning of the BText line. Using the BText approach, the APRS system would need to receive the message to change the display type.

Here's what I've got, My mobile station, callsign N1CPE-9 transmitting periodic Posits for APRS. I show up as a car (as planned). I add the beacon :

[j] APRS Beacon

Set much more infrequently than the posits. The result on my 7.3A version of APRS is the same car I had before. I thought the beacon text would set my symbol to a jeep looking thing (after receiving the first beacon).

Does the -9 have precedence? Would this work if I left out the -9? (then the corresponding conflict with the home station) Has anybody tried this recently?

And, Yes, I know that if I changed my SSID to -12 it would show as a jeep looking vehicle.

73,

- Tom Kinahan

APR REPLY: Most APRS maps of large areas were made from the 2,000,000:1 USGS CD ROM data base. If you calculate it, 1 mile equals about 0.03 inches on the original PAPER map from which this data was derived. Now think about the ability of the summer-hire high school student to digitized that map! I have seen errors of several miles (still only 1/8th inch at the original map scale (only a hiccup away)

So, PLEASE, everyone, use MAPFIX to move your roads over to where they actually show under GPS. Then send me the updated map.

APR REPLY: Good question. I thought the [j] would take precedence, but maybe thts only for the basic callsign (-0). Or maybe you didnt wait long enough until a [j] was received in the L-LIST? Pse confirm both of these possiblities...

I did wait long enough, the [j] is in the L-List. I received a personal reply from Dave in Hawaii indicating that I should use curly brackets not straight ones :

{j} APRS Beacon

Dave indicated that this has been sucessful for him while using a non -0 SSID.

I've got to try the curly brackets and -0 SSID and will let all know.

73,

Tom Kinahan

## 298. 440 APRS monitoring links

From: Bob Bruninga <bruninga@nadn.navy.mil>  
Date: Mon, 16 Oct 1995 19:38:54 -0400 (EDT)  
To: Bob Hartman <n8mwz@alpha.wcoil.com>  
Cc: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.951016192548.10814B-100000@greatlakes>  
Rendered body type: text/plain

Bob Hartman makes a good suggestion. He lives in a remote area of OHIO and although they have a WIDE at 250 feet, they rarely see many DX APRS stations. But if he checks the HEARD log of the WIDE digi, he sees a LOT more calls! This means, of course, that all of the WIDE,WIDE hops are used up by the time his digi hears them, so it doesn't repeat them. Asking the rest of the state to go WIDE,WIDE,WIDE for their sake is absolutely out of the question....

What he suggests is that he will add a 440 TRANSMITTER on the 445.925 APRS frequency which will REPEAT the AUDIO from the 2 meter WIDE DIGI receiver. This way, he and his local friends that want to see other activity in the state, can tune in on 445.925 and listen as if their receivers were at 250 feet!

There is NO need for the reverse link on 440, since the 2 meter stations can simply add an additional hop on their OUTBOUND packets to hit anyone that they see on the 440 link. Not only is this a good solution to his curiosity to see what is "over the hill", but it also begins to use the 445.925 APRS frequency in his area in preparation for an eventual transition there...

Something like this might help in SoCal...

The 440 RX link sounds interesting! That will be something to think about in our area!

Does anyone on the sig have any experience with the REGENERATE option board that is available for TNC's clones? I know that PacComm makes such a thing and I have heard that is some ROSE EPROM that with the use of 1 TNC, the proper EPROM and 2 radios you can set up a sort of simplex data repeater, in on one radio with a re-transmission on a 2nd radio. Everything is kept the same, TX delays etc. etc. guess garbage in garbage out as long as the packet is decoded.

Facts are light on this topic in my area, can anyone else shed some light may work for a UHF or 6M backbone!

Dave's right. If you use the curly braces with the symbol character in between as the first three spaces of your BText, the map will display the new position symbol as soon as the beacon is received.  
p.s to Bob WB4APR...Maybe revise SYMBOLS.TXT to show the {}?

See you on APRS! 73.

Please Please work with your local repeater coordinating committee. The frequency 445.925 is not a packet frequency except in a small town in Maryland! There are many voice repeaters here in California using this frequency. Other areas of the country have used this frequency to link additional voting receivers to their two meter systems. Please do not start a war with the established users.

Part 97 is specific when it comes to who solves the problem when an uncoordinated use interferes with a coordinated use. Unlike the two meter band the 420 - 450 band has sub-bands for auxiliary as well as repeater use. Two meter packet is uncoordinated, except by local band plan. Part 97 requires coordination in the auxiliary and repeater sub-bands. 445.925 is in the repeater and auxiliary sub-band and should be coordinated by a local coordinator. 145.79 is not in a repeater or auxiliary sub-band so the use is mandated by local band plans. No one has exclusive use.

Again this would not work in the major metropolitan areas where this frequency is used for coordinated and sanctioned voice repeaters and links.

> Something like this might help in SoCal...

Would not work at all ... due to the coordinated voice activity on the frequency. The 439 area of the band is suitable for coordinated packet use here as well as most areas of the country. Please check with your local coordinators for a proper frequency. You would not want to interfere with Races or other public service operations. You will also want to make sure the uhf Amateur Television repeaters can continue to operate with out interference to their inputs or outputs.

> DE WB4APR in Annapolis MD. (Not anywhere near Greatlakes)

There are many folks out here that would like all mentions of their uhf repeater frequency removed from the APRS help files.

Ok lets get back to the maps ... Lets see, my friend in southern cal is impressed with my 600 mile path ... it worked as he could see a star at the end. only 9 digis in the path. Lots of new activity in the San Joaquin valley after a demo at the Bakersfield ham fest.

Bob Wilkins raised concerns about just grabbing 445.925.

Let me repeat for the Nth time. I do NOT advocate just grabbing any frequency without first checking with your coordinateing body. All frequencies are used by someone somewhere...

But if you are going to start playing with APRS on 440, take a look and see if you can get 445.925. If it is available, why not grab it.

My suggestion that a 440 remote link from a 2 meter digi might be a good idea in So Cal, should NOT have inferred any given freq. That is a local coordinating issue...

### 306. Same problem

From: intercomm.net!wnolle (William Nolle)  
Date: Tue, 17 Oct 1995 19:02:16  
To: tapr.org!aprssig  
Message-ID: <199510180002.TAA00175@sys1.tapr.org>  
Rendered body type: text/plain

Well Bob, WB7VDN and myself had that same problem with both of us running 73d. A little while trough send some lines back and forth just trough KE4EER-5 we started to get 30 beacons at it time, it sounded like we where running for Meteor Scatter now this happened several times during an hour session. I noticed several messages posted to that effect.

Also found another bug that if i have my map centered on Madion county and i move my cursor on WB7VDN's house on the map and then hit M-P-R APRS crashes to Dos. I will post the exact error-5 message as soon as i get my internet software setup correctly (Have a new address).

Bill KE4EER  
wnolle@intercomm.net

---

### 307. bug in 73d

From: intercomm.net!wnolle (William Nolle)  
Date: Tue, 17 Oct 1995 20:07:57  
To: tapr.org!aprssig  
Message-ID: <199510180108.UAA02117@sys1.tapr.org>  
Rendered body type: text/plain

Bob lost your address so figured i would post the info here, i got the following error.

```
***T
LM,PM: 2    5
a,I,J,K,fdx: 0 9 1 71 0 0
X,Y,X1,Y1 -16.25016  4.16832  -16.25016  4.168.32
A$R
c$
ES$ Back in PLOTCUR
000PS! ERR 5
```

Now this occurs when i have the county map centered on thge following coordinates:

3443.60N  
08631.30W At a 16 mile range

Then if i move the cursor over WB7VDN's QTH at the following coordinates it will crash if i then do a M-P-R. His coordinates:

3436.60N  
08632.22

Now this doesn't happen if you hook his station, but only by placing the cursor over it.

Hope this helps

Bill KE4EER

Looks like the days of grabbing are coming to a close. Now is the time for the special interest groups to formulate their real needs and promote proper band planning.

#### NEWSLINE RADIO - CBBS EDITION #948 - POSTED 10/13/95

Check with your local amateur radio club to see if NEWSLINE can be heard weekly on the air in your area.

Articles may be reproduced if printed in their entirety and credit is given to AMATEUR RADIO NEWSLINE as being the source.

The following is a QST

Repeater coordinators meet in St. Louis and change the very basis of repeater coordination. Also more on the aftermath of Hurricane Opal and another Big MACC attack. These stories and more on Newsline report number 948 for release on Friday, October 13, 1995 coming your way right now!

#### REPEATER COORDINATORS MEET

The nations repeater frequency coordinators have met with the ARRL and the FCC in St. Charles, Missouri. It was a politically charged meeting that has changed the face of VHF operation forever. This is because there is now a tentative agreement by which the American Radio Relay League has tentatively agreed, subject to board approval, to represent the nations coordinators to the FCC. This, in exchange for the commission recognizing the work of the coordinators and possibly making their decisions binding on the ham radio community.

The meeting was held at the Best Western Noah's Ark motor hotel not far from the St. Louis Airport. About fifty of the nations sixty five recognized repeater coordinators were present. Also in the room were representatives of packet radio, amateur television and other modes that use the VHF and UHF spectrum, but from the outset it was made clear that this meeting was to discuss the problems of FM voice repeater coordination only. Even though he was there unofficially, the tone of the meeting was set by the keynote speaker Ralph Haller, N4RH, Deputy Chief of the FCC's Wireless Telecommunications Bureau:

"I'm particularly delighted that all of you have taken time from your schedules to be here and you have shown so much interest in this matter, that you would come to St. Louis on a Saturday.

I would like to ask that we try to stay focused. In talking to you, I know a number of you in this room have lots of other concerns. Enforcement, changes in the volunteer examine program, but that is not what today's meeting is about. Today's meeting is to talk about frequency coordination. An opportunity to get to really get to know each other. And it's an opportunity to bring frequency coordination to yet a higher plateau. So during the day let's stay focused on the real issue of why we are here. Let's not get side tracked on other issues that can easily take up the day. Let's stay focused on frequency coordination. This is a truly historic day in the history of Amateur Radio." Haller, N4HY

Historic yes, but not without its problems. For a while, the entire proceeding seemed to be slipping away as the political differences between various coordinators and between some coordinators and the ARRL took center stage. As a result, much of the early discussion derailed into matters of finite detail rather than the general picture that Haller had requested. So, not unlike other legislative bodies in a state of conflict, the group recessed. It was when the meeting reconvened that headway began. Owen Wormser, K6LEW, the president of the Mid Atlantic

Repeater Council was the person who brought it back on track:

"For the sake of a beginning can we agree that those that are listed in the current ARRL Repeater Directory as coordinators for their specific areas etc. are in fact the baseline from which we can begin. Perhaps, but not the final solution, perhaps not the end of it, but can we agree that that is at least the beginning. Because where the next point goes is, if that is agreed then we have something else to say. And that is that in the longer term our objective is to produce the white paper which will be delivered by a committee from this organization. Not an ad hoc committee. This is our organization. So our committee will deliver to Mr. Haller the white paper. That white paper out of our consensus down stairs will address the specificity of a single point of contact, an organization, not a single individual paralleling very closely the commercial representation to the FCC in the form of a single point of contact. And that in order to get some recognized coordinators to single point of contact, there is a lot of specificity that must be put into this white paper." Wormser, K6LEW

Owen Wormser set the stage for the group to arrive at a consensus, but it would be many more hours before this would happen. A turning point came with the comments of Jim Fortney, K6IYK, who chairs Southern California's 220 MHz Spectrum Management Association. If Owen Wormser gave the assemblage its direction, it was Jim Fortney that added purpose:

"It has become very clear to me and I hope it would be clear to the majority of the rest of you, that the environment that the FCC finds itself in no longer allows us to use the methods and techniques that we have used in the past to deal with them. And that in fact that we better look at some new approaches. And one of those approaches that is being used elsewhere and has been suggested from a variety of directions that would be advantageous to us is if we, and I am talking about amateur radio, not repeater coordination necessarily, but amateur radio in total, we amateur radio had someone who represented us to the FCC." Fortney

Discussions and debates lasted another four hours. In the end it was decided to name the American Radio Relay League as the single point of contact, or spoc, between the nations frequency coordinators and the FCC. A committee chaired by Owen Wormser, K6LEW was empowered to draft a white paper setting forth the goals of the spoc. This paper will be circulated to all the nations recognized frequency coordinators listed in the ARRL repeater directory for comment before a final version is submitted. All of this seemed to please the FCC's Haller:

"Clearly this afternoon, I think tremendous progress has been made. And I look forward to continuing to work with this group and your representatives who will ultimately be working with us directly in Washington. I think this is a giant move forward for Amateur Radio and I think it says a lot that all of you come here with such diverse views and in the course of a few short hours reach this kind of consensus." Haller

There is still a lot to be done before recognition of the work of coordinators becomes reality. Two of the biggest hurdles are drafting a white paper acceptable to most coordinators and for the ARRL's Board of Directors to vote on whether or not it really wants the spoc job. The latter will happen in mid January.

But assuming both of these tasks are accomplished, it may eventually mean that the average ham, people like you and me who simply operate FM with a mobile rig or an HT can be assured that the day of the so-called pirate repeater will come to an end. That our ability to communicate through our favorite repeater with a minimum of interference from another uncoordinated and unwanted repeater on the same channel pair, will be assured. And from a users point of view, what more can an FM enthusiast want.

#### NEW MACC MEMBERS

Also making news in St. Charles is an announcement by the giant Mid America Coordination Council. The big MACC, as it has become known, has swallowed up two more regions. Not surprising was the decision by Eastern Washington state and the Idaho Panhandle to fall under the MACC umbrella. What caught everyone by surprise was an announcement by California's Northern Amateur Relay Council that it too was joining MACC. Don Smith, W6NKF, the President of NARC says its time that hams in California drop their isolationist policies:

"The way that coordination and everything else is going to go. If we have a united front, we have a better of than if we are a bunch of

splinters. And I think we need, in this point in time, a united front."  
Smith

Does this mean that Southern California is next? Probably not. This is because frequency coordination in Southern California is by several different organizations acting as caretakers for various repeater subbands. Also, there is the turmoil on two meters as to who really is the frequency coordinator with nine groups challenging the long term coordinator for that position. Southern California will have to solve a lot of regional problems before any umbrella group will bother to give it an ear.

Meantime, the Mid America Coordination Council is now a consortium of 22 amateur radio frequency coordination entities serving 18 states and portions of 3 others. Each entity is autonomous within the MACC organization with all MACC frequency coordination policies and guidelines being advisory only. In addition to providing mutual recognition of frequency coordinators, MACC provides in house technical assistance and dispute mediation to those regions and entities requesting such services.

\* \* \* Newsline is copyright 1995 All rights are reserved \* \* \*

+++++

Hams may be used to grabbing two meter simplex channels, as the coordinators could not coordinate exclusive use except by mode as described in a local band plan.

The auxiliary and repeater sub-bands have always been coordinated to a amateur trustee for a specific use, location, erp power and area of coverage.

Coordination is far different than band planning as it gives specific rights to those who are coordinated as found in Part 97 of the rules.

I could not find any coordinated packet stations on 445.925 in the ARRL repeater directory. I found ten states with coordinated voice repeaters and found most of the north east coordinators had coordinated the frequency as an fm voice simplex frequency. This makes sense as there are few simplex voice frequencies in the 440 repeater sub-band

Looking closely in the directory you will see many coordinated packet activities across the nation in the auxiliary band near 439 MHz. This is the area of the band we should be looking for APRS backbone frequencies as we grow the network.

Most packet stations would rather be slightly removed from the 440 repeater band so their receiver is not desensed by the local 440 repeater. In the major metropolitan areas of the country packet and voice must share the same hilltop for good coverage.

It is to our collective advantage to have our activities coordinated, then next years grabbers will not be inclined to grab our frequencies.

Bob n6fri

## 309. Update: MacAPRS for Windows

From: sproul@ap.org (Mark Sproul)  
Date: Wed, 18 Oct 1995 09:46:30 -0400  
To: aprssig@tapr.org

Rendered body type: text/plain

To all APRS users

On September 16th, I announced that I was going to port MacAPRS to Windows environment. Exactly one month later, October 16th, I have maps working on Windows. The original schedule is still on track (beta by Christmas, release at Dayton 96).

Since I know a lot of people are VERY interested in the progress, I will be trying to keep you up-to-date via postings to this mailing list. Do NOT ask for beta versions now. I am a long way of from having a version ready to release. But you can see that the hi-resolution maps ARE working. I have a very good screen shot of a Texas state map that you can take a look at.

Check out the MacAPRS web pages at

<http://www-ns.rutgers.edu/~ksproul/APRS/>

Coordination, however, is tied inexorably to band planning and spectrum management. While coordination does offer certain rights to the poordinated parties, coordination is not required to place a repeater on the air, by any stretch of the imagination. Coordination, however, arose to meet the requirements of REPEATERS, and not simplex, and started in a day when digital modes were not even a glimmer in their mothers' eyes.

A number of the repeater coordinating bodies have indicaed they would attempt to coordinate packet operations, but most, that I'm aware of, have let the Packet groups in their areas do that task. In my experience, packet operators, even more so than most hams, have no desire to be coordinated, directed on where to put their radios, or even catalogued. In this regard, APRS is somewhat different.

Remember that in the League's OWN words, the ARRL bandplans are not "national" but are recommendations. Local determination is supreme.

I suspect you're correct and support this. However, in Texas, the packet frequencies are lower in the band!

- > Most packet stations would rather be slightly removed from the 440
- > repeater band so their receiver is not desensed by the local 440 repeater.
- > In the major metropolitan areas of the country packet and voice must share
- > the same hilltop for good coverage.

Very true. Anyone who's had to put up a repeater or TNC in a noisy area is well aware of the problems associated with the bejiggawatt transmitters with no circulator and no notch cavities!

- > It is to our collective advantage to have our activities coordinated,
- > then next years grabbers will not be inclined to grab our frequencies.

Very true. And to do this, you need to speak to the Digital coordinators as well as the overall governing coordinating body in your OWN area. The results of the BOM are not exactly what Pasternak reported, in my estimate. It's gonna take some time to see what falls out and how it affects ham radio as well as other modes than voice repeaters. Still and all: Let's get APRS coordinated!

### 311. Zenith Laptop

From: jbc5@po.cwru.edu (Joe Carter)  
Date: Wed, 18 Oct 1995 21:13:51 -0400  
To: aprssig@tapr.org

Rendered body type: text/plain

I have an opportunity to buy a Zenith SuperSPORT SX 386SX laptop with 3meg RAM/40meg HD monochrome LCD screen for about \$350. I am interested in using it mostly for mobile/portable APRS. Does anyone have any experience with this laptop? Is this a reasonable price or can I do better in this price range. Obviously the machine can run Win386 but not anything else much without a bigger HD and more RAM. Anyone know how easy/hard this machine is to upgrade? It has one Serial port but also a "Modem" port which sounds as though there should be some way to use it as a 2nd serial port. I have followed the Windoze porting debate and understand the advantage of Bob's original "run on a 8088 machine but will I be limiting myself if the port to windows takes off? Also I know the advantages of a Mac Powerbook, just wish I could afford one! Thanks for the help.

APR APPOLOGY: This bug has been in there for a while, and I keep forgetting to fix it. If you move the cursor DIRECTLY south from the center of the screen and then do a M-P-R, you will crash. Sorry... It may also do it NORTH too. But if you hit either the left or right arrow ONCE, then it will NOT crash..

Bill, confirm back to me if this was the case...

>  
>Bob     n6fri

I was tempted to quote all of Bob's message on the future of frequency coordination since it was a well stated message. Frequency coordination has been a fact of life for ages in the non-ham spectrum. It takes 3 months or more for me to receive an allocation and many times they are secondary use allocations that come with severe restrictions on ERP, antenna height and location.  
I hope a serious effort is or will be made to assure UI type packet allocations for APRS can be permanently in place. I truly believe that APRS contains so many benefits for public service, that I'd hate to see it crippled by the lack of permanent protected allocation's

Keith and I now have U-2000's in hand and are coding to the new formats. I saw the U-2000 advertized in this months popular Science, so I assume PEET BROS doesn't mind telling everyone that they are out.

I do not have details as to as to whether they are shipping them yet.

Here is roughly what's new:

It has 4 serial output modes:  
1 normal data logging about 1/sec  
2 packet mode for remote ops with TNC (one every 5 mins w PEAK values)  
3 Modem mode. Outputs on interrogation  
4 DUMP mode. 400 plus bytes of data

The anemometer wind vane looks identical, but clearly has ball bearings and therefore will spin at lower wind speeds... I didn't look at the spec, but it will certainly read to lower values. You can FEEL the difference!

INCLUDES BAROMETRIC PRESSURES AND BOTH INSIDE AND OUTSIDE HUMIDITY!

Cost is above \$350 I think, and I forgot to look to see if the BARO and HUMIDITY and RAIN sensors were in addition to that or not....

I should have looked up more of the details, but I don't have it handy, but for those of you that needed BARO and or humidity and a CLASSY instrument, now it is here! And the remote packet capability is a real advantage for those planning a remote SKYWARN network...

This has been over a year in the making, and it looks like it was worth the wait...

Aloha de Dave/WH6YC, and a long time APRS user. I'm curious though why the DOS version of APRS, and the Macintosh version, APRSM, have the same acronym, but a different name:

DOS version: APRS = Automatic Packet Reporting System  
MAC version: APRSM = Automatic Position Reporting System Macintosh \*

As posted on the APRSM WWW site sponsored by Keith, WU2Z.

Is there a reason why the name is different?

The current "73 Magazine" (November 95) has a very nice article by Bill Brown, WB8ELK, about out recent Atlanta Balloonatics balloon launch.

There are several mentions of APRS in it. There are pictures of both the GPS/APRS payload and the ATV/beacon package.

Everywhere I turn, APRS seems to be being mentioned.

If you look closely, you may see a pic of someone whose name you recognize.

The article is just after the "Homing In" article by Joe Moell, but completely escaped the table of contents for some reason.

>

Even in the first article about APRS, what it actually stood for was a little confusing.

The actual title of the article was Automatic AX.25 POSITION and Status Reporting and a references to the software name was AUTOMATED POSITION REPORTING SYSTEM.  
(ARRL 11th Computer Networking Conference, Nov 1992, Teaneck, NJ Page 17)

Then for a LONG time it has been called Automatic PACKET reporting system.

More recently, many people have been saying Automatic POSITION Reporting System. And I had thought I had seen Bob use this name. Also there was another Web site that listed it as Automatic Packet/Position Reporting System But this would be APPRS, So it really doesn't matter a lot.

The web pages have only been RECENTLY updated, i.e. Oct 16, when we put up the Windoze screen shot. (Check it out!)

The APRSM is only the on-air identifier to allow the Mac version of the software to recognize what machines are Macs and which are not.

The Windoze version will be APRSW, and if we ever do an X-Windows version (For UNIX systems) it will be APRSX.

This allows the more sophisticated software to do fancy things with the information.

To: aprssig@tapr.org  
Message-ID: <199510191246.FAA10357@warpl0.smartlink.net>  
Rendered body type: text/plain

I have both the Paccom, Tiny2 and the KPC 3 TNCs that are GPS capable.

I also have the Garmin 50 GPS along with a laptop that I have been trying to get setup for mobile operation.

I ran headlong into some things that I would like confirmed, suggestions for, etc....

It seems that the Tiny 2 only receives one string (GPP) that the Garmin does not provide. If I am correct, is there any solution?

The KPC 3 on the other hand seems to be capable of using a variety of the strings that are being provided by the GPS...Which one is best to use?

Also, it seems that I remember someone posting some information on the KPC 3 and how to best set things up within the past few months...If anyone retained that info and would send it along, I'd appreciate the information.

Hello!

I planned use the gps receiver that I bought with my tiny 2 last year in a balloon launch. The gps is a Trimble SVEE6CM, (NMEA 0183 ascii format). It has four wire, black, blue, red and orange. Can somebody tell me what is each wire, and the out level, (RS232, TTL, etc). My plan is to send the data in ascii format.

Thanks for your help.

Gustavo, LW2DTZ.

>GPS Receiver Cable Connector Type:
```

Garmin data/power cable wired to DB-25 for TNC, DB-9 for computer and to a coaxial power jack.

>

>Comments:

With parallel DB connector GPS can talk to both computer & TNC. Computer can also upload GPS using Gardown7 software. Computer cannot talk to TNC but could if I added a switch to reverse data in & out (pins 2 & 3) to computer.

TNC and GPS are both powered together. KPC-9612 internal jumpers set to connect DB-25 pin 25 to internal power. 12 VDC can be connected either via TNC coaxial power jack or jack attached to Garmin power/data cable. GPS can also be powered without any other connection via jack attached to cable, I use a cigarette lighter plug in the car.

I also use the Radio Shack scanner antenna coaxial cable (with suction cups) to place the GPS-45 antenna on the car roof.

If you want more detail on the connector pins, I can open the connector shells and record them.

-----

I have successfully used the following combinations of TNC/GPS for mobile operation:

Garmin GPS-50 ver 2.11 with Hardware Single Port (HSP) switch, homemade from the APRS readme GPS docs, and both an MFJ-1270C and a Kantronics KPC-3 with version 6.0 firmware.

I have also used the Garmin GPS-50 v 2.11 with the KPC-3 directly connecting the Garmin brown wire to the KPC-3 serial port pin 2 and the black wire to pin 7. No additional interface was needed.

Both configurations work very well. 73 - Bill WB3V

## 324. Only in Canada ehhhh!

From: david.kerr@projectx.com (DAVID KERR)  
Date: Thu, 19 Oct 95 10:21:00 -5

Rendered body type: text/plain

Hi Bob,

I have been reading all the "debate" over 2m & 450 frequencys and surprised that you have not mentioned the National 2 m APRS for CANADA. We did try an secure the 145.790 2m frequency for APRS but alas it was just

impossible as it was already used by a number of nodes and bulletin boards. We did however manage to secure a National APRS frequency. We went thru the local Packet Freq Coordinator and then up the pipe and this frequency is now recognized by all.

So if any APRS users are travelling in Ontario or Western New York, there are at least five (so far) APRS digi NOW operating. There are 3 in Canada (ehhh) and 2 in W.NY. If others USA areas are having trouble securing the 145.790 freq, possibly 144.390 would be a good alternate.

Is it possible to get a list of Canadian Registered APRS users so we can keep in touch.

73 de Dave, VE3FGK

### 327. Digitizer tablet help needed

From: BOB DERDERIAN <n2iph@beta.delphi.com>  
Date: Thu, 19 Oct 1995 13:18:18 -0400  
To: aprssig@tapr.org  
Message-ID: <199510191718.NAA15406@ernie.beta.delphi.com>  
Rendered body type: text/plain

Hello all,

I have a CalComp model 2500 tablet that I have been trying to get to work with mapfix15.exe or any previous version of mapfix. I have the tbalet, 16 button mouse, and necessary cabling (I think). I need to know how to setup the tablet so it will communicate with serial port of my computer.

There is a menu line at the left top of the active area which has 8 selections as follows;

```
-----  
-----  
      1      |  2  |  3  |  4  |  5  |  6  |  7  |  
8      |  
TRANSDUCER | USER 1 | USER 2 | PROXIMITY | TRANSMIT | RECEIVE | HANDSHAKE |  
DISABLE |  
-----  
-----
```

Each of these boxes also contains a LED which can be toggled on/off. Towards

the top center of the active area of the tablet are three more such boxes, they are labeled;

TEST | SETUP | BANK |  
-----

There what appears (though not marked) a reset button located on the back of the tablet between the mouse port and the serial jack, is this its function?

The tablet appears to be working OK, I can click on any of the menu boxes and the LED will toggle from its current state. When the mouse is over the active area of the tablet and I click any mouse button the transducer and transmit LEDs light momentarily. I do not have any CAD or drawing software that will work with this tablet, only mapfix. I have used a SummaSketch with mapfix without problems. Tried obvious stuff like swapping serial cables, COM ports, even different computers.

When I click the mouse button while running a terminal program on COM1 set for (assumed PARAMs) 96,N,8,1 I see nothing on the screen, not even gibberish. I have tried different combinations of baud, parity, etc to no avail.

What I would like from anyone in the SIG or elsewhere is some info on how to set this tablet to work with mapfix15 and what the menu boxes on the tablet are for. A photocopy of some manual pages explaining this would be helpful and much appreciated.

TNX es 73...Bob

APR REPLY: The machines are different, and Keith wanted a way to make it obvious that the packets were coming from a MAC machine without waiting for the position/symbol. APRS also stands for AUTOMATIC POSITION REPORTING SYSTEM too, depending on the context.

-----

If we are running a standalone (no computer) GPS tracker what would be a good APRS string to use to let people and software know about the setup.

I have been using the following strings with my KPC-3 GPS tracker:

LTP

1 APRSM VIA RELAY

2 APRS VIA RELAY,RELAY

3 NONE

4 NONE

But this leads people to believe it is a full computer run APRS system and they try to send messages.

Do we need to use a different string for trackers like APRST. ???

The ONLY software that currently does anything with this info is the Macintosh version.. The Windoze version will too..

For a stand-alone tracker run

unproto APRS via <what ever is appropriate....>

do NOT use APRSM or anything else..

Keith

>also stands for AUTOMATIC POSITION REPORTING SYSTEM too, depending on the  
>context.

The APRSM, is ONLY, I repeat ONLY the text that gets transmitted over the  
air in the TO field of the packet. The name of the program has NEVER, I  
REPEAT NEVER been APRSM. It has ALWAYS been MacAPRS. Bob's original  
article used both  
Packet and Position, for the "P" in APRS. After reading over the original  
article several times, it appears (I don't mean to be putting words in Bob's  
mouth) that Bob's original intent was "Position".

Again, the Mac version is "MacAPRS", NOT "APRSM".

It is our intent, for the name to be:

Mac Automatic (insert P-word here) Reporting System

By the way, for those that have not noticed, the Official name for the  
Windows version is

"MacAPRS for Windows"

MacAPRS for Windows is coming along very good, I posted a message yesterday  
about the progress and we have an early screen shot up on the web at

<http://www-ns.rutgers.edu/~ksproul/APRS>

Mark Sproul  
KB2ICI  
Keith's Twin Brother  
MacAPRS co-author  
(the guy behind the scenes that makes lots of the bells and whistles work,  
also the guy that is porting MacAPRS to Windows)

Rendered body type: text/plain

Hi all!

Just saw this cool toy in the Garmin catalog. The TrakPak is a combined GPS receiver/antenna with just a serial/power cable leaving it. It looks like it's about 3x2x1.5" (not sure, tho). No display. I guess it talks NMEA and/or Garmin protocol. The price list was \$240 in lots of 5-99 units.

To me, this looks like the ideal mobile tracker GPS unit (except for the PacComm integrated GPS/TNC combos) Real small, no need for a display, no annoying antenna and cable (ok, just one less cable to deal with). Just put an adhesive backed magnetic tape on the back and the whole GPS is magmount!]

Anyone play with this yet?

>
> It seems that the Tiny 2 only receives one string (GPP) that the Garmin
> does not provide. If I am correct, is there any solution?

```

Nope. the Tine2 expects a rational datastring: The NMEA GGA sentence which gives position and altitude in one string. The GPSTEXT command in the Tiny2 allows you to customize it so you can grab something else... I have been known to set mine to \$GP and grab all the NMEA strings.

Within the NMEA standard, the precursor \$GP indicates the information is NMEA 0183, and produced by a GPS engine. The next 3 characters (ie., GGA) indicate the NMEA standard sentence type. In the case of manufacturer-specific or proprietary sentences, they'd issue soemthing else, like \$PGXYZ for a proprietary, Garmin sentence called XYZ... whatever that might be.

```

> The KPC 3 on the other hand seems to be capable of using a variety of
> the strings that are being provided by the GPS...Which one is best to use?

```

Because of some initial problems with the KPC3 when I first met it I developed an irrational preference for the Tiny2. That, and I have about 25 of their smaller cousins on some cows right now!

The KPC3 offers some potential advantages, which PacComm is aware of, and I \*think\* is going to address: Being able to change parameters from afar, chief among them.

Me? I'll stick with the PacComm hardware.

73, gerry

To: aprssig@tapr.org  
Message-ID: <199510191828.AA14812@server1.startel.com.ar>  
Rendered body type: text/plain

Hello!

I planned use the gps receiver that I bought with my tiny 2 last year in a  
balloon launch. The gps is a Trimble SVEE6CM, (NMEA 0183 ascii format).  
It has four wire, black, blue, red and orange. Can somebody tell me what is  
each wire, and the out level, (RS232, TTL, etc). My plan is to send the data  
in ascii format.

Thanks for your help.

Gustavo, LW2DTZ.

### 342. Standalone trackers

From: Dick Mead <mead@skat.usc.edu>  
Date: Thu, 19 Oct 95 17:36:28 PDT  
To: aprssig@tapr.org  
Message-ID: <CMM.0.90.2.814149388.mead@hamal.usc.edu>  
Rendered body type: text/plain

One method you can use to prevent (or discourage) folks from connecting  
to your standalone TNC/GPS tracker is built into many tnc's. If your  
tnc has "cmsg" and "cmsgdisc", you can use it to send a polite message  
to anyone connecting to the tnc and then it automatically disconnects.  
You should also probably set users=0, unless the tracker needs =1...  
I use this method on my tracker and it works fine. My message points  
connectees to the proper place.

My tracker is a MFJ 1270 with 1.1.9 eprom and Magellan Meridan.

Bob, when I ordered mine last week they said it should ship in about 2 weeks.

> INCLUDES BARROMETRIC PRESSURES AND BOTH INSIDE AND OUTSIDE HUMIDITY!

Big plus for skywarn activites!!!

>

> Cost is above \$350 I think, and I forgot to look to see if the  
> BARO and HUMIDITY and RAIN sensors were in addition to that or not....

YEP, humidity and rain sensors are extra. They now have a Rain gauge that will read in 100th's of an inch and comes in either a wired or wireless version. The Wireless version should be useful at home in geeting the gauge out away from the trees.

Then unit also has about 200 different output statistics, Where is my fax from them when I need it.

> This has been over a year in the making, and it looks like it was worth  
> the wait...

If it is anything near what I read in the FAX it not only was worth the wait, but WELL worth the extra \$\$\$ over the Ultimeter II (and it was good).

>  
>I do not have details as to as to whether they are shipping them yet.

For those of us who already own U-II's...(I have a main and remote unit)

1. Will existing rain gauges work by simply plugging in?
2. Will therms work same way?
3. Can a new control head be purchased, leaving anemometer etc (as above) the same?
4. Interconnect compatibility with an existing U-II.

...or do we have to start all over? TIA

Replying back to the list does not help the people who had made the mistake on subscribing.

You have to send e-mail back to the person directly.

Cheers - Greg

Message-ID: <9510192041.AA03282@oscar.tbr.state.tn.us>  
Rendered body type: text/plain

I recently purchases an Icom 2A and a 2AT to use with a KPC-3 and a Garmin GPS 45. I have the interface for the Garmin and the KPC-3 figured out and working fine. On the other hand I am not having much luck with the IC-2A/2AT and KPC-3. I am only getting 1 or 2 packets out of a whole days worth at 1/minute. I am using an MFJ cable that is supposed to work with the Icom and worked fine with an Alinco. Does anybody have any experience with this combination? Any settings or adjustments that you can reccomend?

TIA  
Bruce

Bill I still think the problem is with your internet provider messing up your return address since it shows up on the sig as:

intercomm.net!wnolle@tapr.org (William Nolle)

You might try subscribing by using:

Listserv@tapr.org

subscribe aprssig william nolle wnolle@intercomm.net

This works with some listservers so that you can subscribe from one address but have the mail delivered at another.

Hope this helps,  
Bruce

> and they try to send messages.

APR REPLY: Then they are being lead astray. The path has nothing to do with your hardware. The key to whether a station is APRS or MESSAGE capable is:

1) ONLY stations whos posit begins with an @ can talk. And they show up in bright white.

2) all other colors cannot be talked too... with some exceptions....

## 352. Finally made it

From: intercomm.net!wnolle (William Nolle)  
 Date: Thu, 19 Oct 1995 22:17:19  
 To: tapr.org!aprssig  
 Message-ID: <199510200318.WAA19386@sys1.tapr.org>  
 Rendered body type: text/plain

I think i finally made it back on the sig (I hope). Well at least i received conformation from tapr.org. There's a great way to do this i just found out by logging into the following address and page.

<http://www.tapr.org/html/sigs/html#listserv/>

It will show a menu for all the tapr sigs and info you want, all you do is fill in your name and e-mail address, check it out works great. And thanks to those that attempted to help me!.

Bill KE4EER

## 353. APRS vs GPS

From: Bob Bruninga <bruninga@nadn.navy.mil>  
 Date: Thu, 19 Oct 1995 23:31:19 -0400 (EDT)  
 To: aprssig@tapr.org  
 Message-ID: <Pine.SUN.3.91.951019232756.974C-100000@greatlakes>  
 Rendered body type: text/plain

Someone wrote that TRACKERS should be addressed to GPS vice APRS.

That is not bad to use GPS, but it was not my intent. You may see it, since

the PacComm defaults to TO GPS unless the user sets in something else.  
But I always use UNPROTO APRS VIA RELAY,WIDE,ETC

DE WB4APR in Annapolis MD. (Not anywhere near Greatlakes)

### 355. APRS vs GPS vs APRST

From: kc5ejk@onramp.net (Robert Winingham)  
Date: Fri, 20 Oct 1995 00:47:37 -0500  
To: aprssig@tapr.org  
Message-ID: <v02130500acace52e020c@[199.1.11.158]>  
Rendered body type: text/plain

Here is the start of a FAQ about  
How to identify the different types of APRS system .

--Note --- set line length to 87 -----

APRS standalone GPS tracker data: Example from Garmin-45 and KPC-3 TNC

-----  
KC5EJK-9\*>RELAY>APRS:\$GPRMC,181027,A,3250.152,N,09645.063,W,000.0,334.6,1110  
95,,\*04  
KC5EJK-9\*>RELAY>APRS:\$GPGGA,181048,3250.150,N,09645.069,W,1,08,1.0,150.5,M,-  
24.8,M,,\*7E  
9 for Car symble

KCP-3 beacon in GPS mode:

-----  
KC5EJK-9\*>RELAY>RELAY>ID:KC5EJK-9 RELAY/D KC5EJK-1/B

A Mac computer APRS station:

-----  
KC5EJK>RELAY\*>APRSM:@122054z3250.76N/09645.71W-PHG5140/Bob in Dallas -201-<0d>  
Call M for Mac @ Time Lon/Lat Ant gain/power/text string  
-version -<??>

A DOS computer APRS station:

-----  
K5DTN>RELAY\*>APRS:@121729/3255.77N/09646.72W-Claude APRS7

A mobile Mac computer APRS station with a GPS system:

-----  
KC5EJK-1\*>RELAY>RELAY>APRSM:@150359z3249.93N/09642.03W/318/016/ Live GPS  
Data -201-<48>  
KC5EJK-1\*>RELAY>RELAY>APRSM:KC5EJK-1 \*150359z3249.93N/09642.03W/356/041

Note the @ in the computer APRS stations data and  
as Bob Bruninga said: " ONLY stations whos posit begins with an @ can talk. "

I would guess that if the software ever needs to identify a tracker system  
then the ":\$GP" string is the giveaway and we need not use APRST or GPS.

I am going to do as Keith/Bob said and use APRS for my standalone trackers.

OK you beat the system using a web browser rather than use your mailer software.. But your from: address is still broken. Look carefully at the config for your mail reader and see if you dont have your user name and mailserver or host name out of order or something. You may want to ask your service provider for help, they have probably had this happen before.

We can not reply back to you due to the malformed address. You might try a different mail program if all else fails...

### 359. Green WIDE problem with 7.3d?

From: Larry Griffin <largriff@onramp.net>  
Date: Fri, 20 Oct 1995 08:04:47 -0500  
To: aprssig@tapr.org  
Message-ID: <199510201304.IAA28948@mailhost.onramp.net>  
Rendered body type: text/plain

I put up a WIDE digi (TheNet node) yesterday but instead of showing green (as it should) it shows white.

The BeaconText is:  
!3328.41N/10147.35WxPHG9560/WIDE/LBB01/Lubbock TX

Is the problem with 7.3d or with me?

Larry

### 361. F-10 "Doz" feature

From: Larry Griffin <largriff@onramp.net>  
Date: Fri, 20 Oct 1995 08:38:03 -0500  
To: aprssig@tapr.org  
Message-ID: <199510201338.IAA02928@mailhost.onramp.net>  
Rendered body type: text/plain

Bob, I like the F-10 "Doz" function!

I have an Ultimeter-II running with APRS at home and its nice that even when APRS is "Dozing" it still shows the weather data (in text mode). When I'm using other windows applications I let APRS "Doz" in a window rather than iconized, and it shows me current weather all the time. When I want to "Un-Doz" APRS I simply hit Alt-Enter to return it to full-screen mode first, then I can use any other APRS function.

This makes me realize that it should be possible to show other things like the P-list and Msg screen in "Doz" mode. What do you think Bob?

APR REPLY: All recent APRS software, will only show a WIDE-RELAY digipeater  
in green. You must have two callsigns in the NODE to be WIDE and the  
other to be RELAY. Once you have done this, you should put the words  
WIDE-RELAY in the BEACON text where you currently have WIDE.

For info on the importance of having WIDE-RELAY digipeaters, read DIGIS.txt.

Since mobiles will usually use an unproto path of RELAY,WIDE, that is why  
it is important to have your NODE support the alias of RELAY as well...

In-Reply-To: Message of 10/19/95 at 20:14:59 from moyers@ibm.net

I have the Peet Bros. literature on the U-2000, and it says that the  
humidity sensors, as well as the rain gauges, are optional. There is  
both an indoor humidity sensor and an outdoor sensor. The indoor sensor  
is listed at \$100.00 and the outdoor humidity sensor is \$110.00. The  
0.1" raingauge is \$67.50 and the .01" gauge is \$90.00.  
They also now make a U-500 that is w/o pressure or humidity capabilities.. It  
is listed at \$199 as a special introductory offer until 12/31/95.  
And then, there is an upgrade kit for the U-II; "you'll have the Model 2000  
and almost everything you need to use your Model II as a remote". Offer for  
the upgrade expires 12/31/95.  
good luck! de Jack coster, WF8X.

Soory for sending this to the SIG instead of just personally. (have to learn  
the quirks of this new mailer program) but to asnwer your question, you have  
to read the text file called Digi.txt. YOu have the string wrong. Instead of  
just "WIDE" after the PHG section, it has to be "WIDE-RELAY" Then put at least  
an extra space or two before any of your comments.

I think i finally made it back on the sig (I hope). Well at least i received  
conformation from tapr.org. There's a great way to do this i just found out by  
logging into the following address and page.

<http://www.tapr.org/html/sigs/html#listserv/>

It will show a menu for all the tapr sigs and info you want, all you do is fill  
i n  
your name and e-mail address, check it out works great. And thanks to those  
that attempted to help me!.

> a different mail program if all else fails...

In fact, we can... but one must interpret the bang! addressing... something  
that was supposed to have died 2 or 3 years ago. When your see  
intercomm.net!wnolle@tapr.org You should think wnolle@intercomm.net.

And yes, Bill, it is still broken. I'd call the tech support at intercomm and  
ask for some help reconfiguring. It could very well be in their sendmail  
installation, rather than in your mailer config, too.

73, gerry

> Those of us that drive tend to reach over and poke individual keys like O Q  
> <Enter> during available attention cycles. One of the nice things about the  
> DOS version is that we can use simple non-shifted, non-Alt'ed and non-ctrl'd  
> key combinations. If we had to use strange combinations of keys to make  
> windows drop down and then select, it would really divert out attentions!

We WILL support Command-Keys and Function Keys.. But they will match the WINDOSE standards.... We will make sure the 'common' things needed while driving are available on Function Keys.. You can be sure that not all of this will be done at the beta-release at Christmas.. As we get closer we will investigate to make sure we know what needs to be done on Function Keys for things like this... Your 'EASY WHILE DRIVING' request is very valid...

> When a CD-ROM is not present and someone selects a callbook lookup- it  
> seems that there is no way out of the resulting menu without rebooting. The  
> menu is the one that asks what type of CD it is: Buckmaster, etc. And Why  
> is SAM not listed? Can the Mac not read the SAM CD?

If the CD-ROM is not present, then it tells you that..  
CALL NOT FOUND OR DATA BASES NOT PRESENT...

I went back and tried this on SEVERAL different versions, including the latest and got the same message in all cases.. It never hung once..  
Give me more details and I will find out what is going on..

SAMS: All of the manufactures of CD-ROMS !!!EXCEPT!!! SAMS where very cooperative when I wanted to do this.. The SAMS people said they would supply a DOS only API (Application Program Interface) library, but that is all they would do.. They weren't even interested in discussing it any further. There data is in proprietary format, and can ONLY be accessed via their API.

Another comment about CD-ROMS.. The NEW Buckmaster (November release) is ABSOLUTELY FANTASTIC!!!! They have GREAT info in the data base..  
Better than anybody else for this type of application!!!

> And I also notice that when "normal" APRS Maps are imported into MacAPRS,  
> the labels all show up at all ranges. This really clutters the map. Is this  
> normal, or something we are doing wrong?

This has not been a problem in the past, because most people using MacAPRS are using not the PC maps.. If it becomes a problem, it will get changed..

> When we zoom into a map, it seems that the options are limited. Something  
> like 2x or 4x or the like. Is that it? I could not zoom nearly down to the  
> level that I could in "real" APRS.

Try using OPTION-Click-Drag.. This allows you to zoom into any size, any area you want....

> And how do you stop a message that never gets acked?

Messages get sent once a minute for 5 minutes, then once an hour for 5 hours then they stop sending.. If you want to 'ABORT' it, select it and hit DELETE.

If you want to RE-TRANSMIT a message, hit CLEAR, it will reset the counters to zero..  
Also, R does a REPLY to that message.

Rendered body type: text/plain

Dear Bob:

I have found APRS to be a very interesting and enjoyable program...My registration is in the mail along with a disk containing an APRS map making program created and designed by myself, WD8JTJ and WD8JTK. The disk also includes a copy of the Volusia County, Florida map (VOLUSIA.MAP) made by myself and WD8JTJ. I hope you find them of interest.

If the coastline of Florida in the USAseast.MAP were drawn with the same accuracy as the Florida coastline in the USA.MAP people would stop asking me why my house is in the Atlantic ocean.

73...Bob, WB2NGZ

Larry, the answer is NEITHER. Only Wide area digi's with the ALIAS of  
WIDE/RELAY will turn green..this is generally only available in certain  
tnc's like the KPC-3. Wides with an alias of only WIDE, turn white, as  
yours did.

Almost.

An 8 or 7 pin DIN socket will fit it.

But better drill out or fill all other holes, lest ye accidentally plug it  
in wrong and fry something

(the key does not function on the din socket)

But that is what I use on my 45

Ralph

I have found an easy and effective substitute for Garmin cable. I made my own using pins from a tube socket. Merely remove pins from a tube socket and attach wires and heat shrink tubing. The pins from a tube socket (such as a 12AX7) fit the garmin perfectly. Get an old socket from a hamfest and save a few bucks

OK, then, if that's the case, I hope somebody will explain to me why the  
KPC-3 I just put up in North Central IL as a WIDE/RELAY shows green, when I  
just found out that  
it has the parameter NUMNODES=0, which is the default mode. The Beacon does  
not show any MYNode.

I suspect that it's the "WIDE-RELAY" in the POS text that makes it show  
green, regardless of what's set in the tnc. I will fix that problem  
within the next few days.

>I would like to know if the Delorme maps will work with MacAPRS.  
>That would be a blast, but I didn't know the Delorme maps had latitude and  
>longitude references attached to them.

If you save the Delorme map screen image as a PICT file you can use a  
feature of the latest version of MacAPRS to make an overlay.

Version 3.0 of Delorme maps for the PC does have a limited lon/lat references.  
Also this is the first upgrade I know of that you must send in the old  
CD-ROM.

----- From the 2.0.0 text doc file -----  
MacAPRS now supports BIT-MAP maps, i.e.

- \* a scanned in nautical chart
- \* a screen-dump from Delorme
- \* a fancy map TIFF file from the USGS
- \* Any map you want to scan in on your scanner.

In the near future, I will put up some test-maps on ftp.tapr.org that have the  
correct EXTRA data that makes this work.

MacAPRS needs a special RESOURCE attached to a normal PICT file to make all of  
this magic work.

Steve Dimse (K04HD) from Florida is working on a simple utility to add the  
coordinates to the files. In the near future, MacAPRS will have this capability  
too.

### 392. Re: [APRSSIG:3930] GPS HELP

From: Tom Tessier <tessier@cc.umanitoba.ca>  
 Date: Sun, 22 Oct 1995 00:23:22 -0500 (CDT)  
 To: aprssig@tapr.org  
 Message-ID: <199510220523.AAA28219@hadar.cc.umanitoba.ca>  
 Rendered body type: text/plain

Here is the connector configuration of the GPS board:

|                                 |   |   |
|---------------------------------|---|---|
| GPS board (Trimble SVeeSix-CM3) |   |   |
|                                 |   |   |
| connector location->            | 8 | 7 |
|                                 | 6 | 5 |
|                                 | 4 | 3 |
|                                 | 2 | 1 |

Follow the wires from the connector to find out what they do. Use an ohmmeter or something to check which wires are on which part of the female part of the connector. Unfortunately, this will remove the battery backup of the almanac, but the GPS will replace this info with a cold start the first time you turn it on. It will take 10 or 15 minutes to acquire sats, but once it does, it will update its almanac.

Pin Functions:

- 1 No connection
- 2 VCC (+5 Volts DC)
- 3 TXD1 (TTL level serial out - this is where the data originates)
- 4 Battery backup for almanac/RAM (+3 to +5 Volts DC)
- 5 RXD1 (TTL level Serial in) not used on these
- 6 One Pulse-per-Second output (TTL Level)(works, but not used by TNC)
- 7 RXD2 (TTL level serial in) (not used)
- 8 DC ground

email me if you have any questions.

I finally had an opportunity to check my mobile tracker symbol on an APRS screen.

It is indeed true that the symbol characters of mobile trackers need to be enclosed in curly brackets. I did discover that it needs the first posit after receiving the beacon with {j} to change the displayed symbol.

Thanks for everyones help!

397. girdsquares

From: "HOLCOMB, GREGORY FRA" <LYNN4YCI@MUSIC.CC.UGA.EDU>
Date: Mon, 23 Oct 1995 13:30:56 EST
To: <aprssig@TAPR.ORG>
Message-ID: <23OCT95.14597094.0068.MUSIC@MUSIC.CC.UGA.EDU>
Rendered body type: text/plain

this is the first posting i have made so excuse my ignorance
but i had a thought on the grid square mode of aprs
if an additional charater was used the position of a station
could be made much more accuratly and there by making it more
useful. An example of a narrow grid square would be em83d ie
a b c d e f
g h i j k l
m n o p q r
s t u v w x
this would make the use of the posible up coming aprsat much
more useful because lets face it a grid square is a big place
i dont know the figures on exactly how many more bytes this would
require in each packet but i thought somebody with some more knowlege
might know if it is possible or even nessesary.

Thanks Lynn Holcomb

APRS has a built in higher accuracy mode that takes 3 mor characters and
includes course and speed. But until we start getting the 6 digit mode
used, I wasnt going to cloud up the works....

ITS DONE AND IT WORKS. May be releasing in a day or so. (will be APRS74)

402. Marine Corps Marathon 95

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 23 Oct 1995 19:59:33 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.951023195300.4130B-100000@greatlakes>
Rendered body type: text/plain

APRS at the Marine Corps Marathon 1995

1995: This year we had fewer GPS trackers and relied almost entirely on the Dead Reckoning features in APRSdr.EXE. This program can dead reckon objects along the marathon route without operator intervention except when needed to correct for long term drift between the runner and the Dead Reckoned object. The LEAD runner goes about 9 Knots and the Tail goes about 4 Knots. Also, these tracks DO follow the exact course, where GPS vehicles often do NOT reflect the real path of the runner (where vehicles are not allowed). We also DR'ed the lead Handicapped, Woman, Special-Olympics and PACK. See DR.txt.

MASTER-SLAVE. This year we also operated three 486 color laptops and two larger VGA displays all connected to the single APRS TNC. Only one laptop was operated by the APRS operator as MASTER, and all other laptops were placed in SLAVE mode in front of the other voice net controllers, so they could independently zoom in to areas of their immediate interest. If we had had more VGA monitors, each laptop could have also driven an extra large display. The small size of the laptops fit unobtrusively at the operating positions. See OPS.txt.

IMPRESSIONS: This year was dissappointing compared to last. The 70 + HAMS who have always been the ONLY dispatch authority for the last 18 years and who had always done an OUTSTANDING job, were surprised when they started directing ambulances and found they were already moving under other authority. Apparently, with the new 800 MHz radios out there, the variety of ambulance companies could ALL communicate with the County dispatcher.. In the past, each ambulance company had their own radios and could NOT communicate except via a HAM rider. This year not one general, doctor, or person in distress ever popped into our tent to get the latest (a CONSTANT occurrence in the past). Even the Marine Corps had cute little commercial HT's instead of the hoot-n-holler field phones they used up to last year!

Overnight the HAMS slid from HEROES to a footnote... The mood in Net control was gloomy.

What this tells me, is that TECHNOLOGY MOVES ON... HAMS have always prided themselves on their emergency response, primarily because of their frequency agility. But with programmable radios EVERYWHERE, the HAMS no longer have an edge. We have had programmable HT's for 15 years... Now that everyone else has them, what NEW can HAM radio bring to an event?

How about APRS?

Good question. But how many years will it be until most HAMS that get out there at 4 AM will trade in their commodore 64's? We had only 5 GPS trackers show up this year vice 11 last year, and fewer than a handful of APRS ops. With my 6 screens, it still looked impressive in Net Control, and the one screen we placed in the Marine Corps tent had a Lieutenant

GLUED to it the whole event as if it were a crystal ball... but it was a facade. I was the only operator that had ever touched APRS. (The other few APRS ops were out on the road). We just haven't gotten the attention of the EMERGENCY RESPONSE HAMS in the area.

I do not solicit APRS for these local groups since that would appear to be a conflict of interest for me, but in those areas where at least ONE person on the INSIDE of the EMERGENCY COMMS groups has gotten turned-on to APRS, there seems to be a lot more success... But I still have not seen any APRS articles in the major ARES publications...

Get those operators TRAINED. With a multiple SCREEN setup, you only need ONE good APRS operator at the MASTER, but everyone in the emergency response team, should be familiar with the basic CURSOR, ZOOM and MAP display. The P and L list also come in handy... Good luck guys!

The GRID-SQUARE system as established by international groups includes not only the 4-digit Grid-square used in APRS, but ALSO a 6-digit grid-square in the format of

FN20AL (alpha, alpha, digit, digit, alpha, alpha).

And at one time, there was discussion about actually extending it to 8-digit. There is a booklet that explains all of this including software on how to create grid-squares available from the ARRL.

APRS (Or at least MacAPRS) already supports 6-digit grid squares...

Hello all,

After reading Bob's note on the USMC run I thought I'd spread some good news about using APRS in Public Service/Emerg Response situations and who is looking at it as a tool.

On 14-15 Oct myself and Dan N9XHP attended the United States Coast Guard Aux- Ninth Western District Fall Conf. we convinced Dave KA9NHL to tag along as an "observer".

We conned the hotel staff into setting up an extra display table outside the meeting/seminar rooms, hooked up both a MAC and DOS system (the MAC was live on air via 100' of RG8 and a Mag mount on an ashtray) and off we went.

In a word we were swamped, we handed out over 70 copies of APRS program disks, gave out every handout we had taken along and talked ourselves out. At one point we had an O6 (full Capt.) from Cleveland home of the Ninth District with us as we demo'd the system. He watched as we showed him what APRS can do in terms of DFing, Uplinking and Tracking objects. He commented to us that at USCG District level they are using a system that while much more capable still looks the same. It cost \$300K for the software alone. We then told him what we have tied up in hardware and software and explained we could buy a couple of nice boats with what's left over. The Capt was impressed enough to offer his offices assist in :

1) Providing CDROM Marine Charts for mapmaking efforts (MAC and WINDOZE here it is, and maybe the new 100k format DOS stuff to)

2) Work toward getting approval for a specific VHF govt freq. to be used in testing system. (Bob, maybe this is a start toward getting channel 70 DSC limited approval for APRS style traffic- APRS Lite???)

I should also mention that He knew of the incident out east using APRS to DF a flare on Lake Erie, the one where the DF position was off by 100 Meters. As his shop is SAR stuff the word is spreading.

Stay Tuned

CAP

Sunday 22 Oct Dan N9XHP, Karen (XYL) N9RER and myself served as Observers for an Illinois CAP demo on APRS. The unit put up two Aircraft and one ground team with standalone tracking units that their Com Guy Mike (call pending) and I wired up.

Units were KPC-3, Magellin and Garman 50 GPS, and FT411 MARS/CAP HT's.

We tracked all units without trouble, connected and changed settings in KPC3 while on the fly (groan) and in short knocked there socks off. A plus to this mission is that several of the High School aged or younger Cadets are now going after a Ham ticket!!!!

The CAP mission commander told me that so far he has heard only about Illinois and Arizona CAP using the software, if anyone wants to contact a local USCGAUX or CAP unit to demo or offer assistance (or join) if you get back to me Ill find a contact for you.

Last Stuff

I'll post the CAP track history file at tapr as CAPMSN22.hst for ur DL. If in area (No. Ill) the NIAN users group meets this Sat at 10AM, message me at edwardwr@interaccess.com for details.

I'm forwarding the following from the nos-bbs list - there's starting to be some APRS type interest in the TCP/IP community.

GPS support over IP has been available with TNOS since release 0.99b (January 1993). It allows you to receive data from a local GPS, and send it to a server. The server can receive from any number of remotes via UDP packets.

It would be simple to place this into JNOS and also to make it be able to accept UI frames addressed to special addresses.

406. Keying Circuit for HT's

From: edwardwr@interaccess.com (Edward W Rogers)

Hello,

I've seen several posts about folks having trouble keying HT's with a TNC.
This is what I'm using and I have yet to find a combo it will not work with
but I know one of you will <grin>.

First pick up a Radio Shack Audio-Iso Amp xformer I dont have the part #
here in front of me but its with the small xformers in a Radio Shack store,
costs about \$4.00 and is the size of a dime.

Its Got 4 small wires coming out of it...

Yellow.....Hook to mike tip
Red.....Hook to PTT
White.....Hook to AFSK out
Black.....Hook to ground

You dont need any resistors or caps in line anywhere.
Works good and lasts a long time...

For you who have Motorola Cards and Tiny 2's here is wire hook ups for stand
a lone trackers..

PTV6 Card		TNC
Blk wire	TX data	DB9 pin 3
Red wire	RX data	DB9 pin 2
Whi wire	Ground	DB9 pin 5
Brn wire	Memory float hook to +9v DC	
Shield	hook to 9v DC grnd	
Grey	12v DC power in to PTV6 card	

if you connect these wires internally a serial cable talks to TNC, add a
null-modem adapter and presto you talk to the GPS.

Although I've not used or even seen APRS in operation, I'm slowly working
toward putting together a system. Also, I'm a member of a horseback
riding organization based in Maryland which has a SAR team and have been
talking with them about using APRS in their SAR operations. The TROT
(Trail Riders Of Today) SAR team serves a five state area (MD, VA, PA, DE
and WV) and often has to work with the CAP, State Police and other
emergency agencies. Several of the members have expressed interest in what
I have described to them. I did give them a copy of the reports that were
prepared by the AZ WING CAP. Hopefully in the next few months, I'll be
able to demo a system for them.

My other plan is to reactivate TROT's trail mapping activity and use APRS
to generate trail maps by just going for ride with the equipment on
horseback then printing out the track.

Larry and Bob, all is not lost: It is true the technical advances have vastly improved communications between agencies and within agencies whom we serve...however, how many police officers, fire fighters, and paramedics do you know who can make an antenna out of a coax cable or a bunch of copper piping?

We have a saying here...when the ship hits the shore, the towers all fall down. Local government here loves their 800 MHz trunking system, but they are smart enough to realize how vulnerable that equipment is to natural disaster. Two county owned amateur radio repeaters now on the air intended strictly for ARES/RACES during disaster ops...complete with generator power and access for antenna replacement.

It used to be our equipment that made us invaluable...more and more its our knowledge and our willingness to serve in an emergency that counts.

PS. The National Weather Service, Red Cross, and Salvation Army, to name a few, still need our communications equipment and skill.

411. What Northridge Taught Us!

From: Randy Hammock <hammock@taz.gmd.trw.com>
Date: Tue, 24 Oct 1995 14:31:30 -0400 (EDT)
To: aprssig@tapr.org

Rendered body type: text/plain

(From an article in TAC-ONE, San Diego County RACES newsletter, Spring '94 by Ben Green, WD8CZP, Chief RACES Radio Officer.)

What has the Northridge earthquake taught us that the others haven't? Here is a summary from an article in the San Diego County RACES newsletter right after the event.

We in RACES need to wake up and quit 'playing ham radio' and receive training in multiple disciplines, particularly in other services' radio communications.[1] The RACES job is to provide skilled operators, equipment and, yes, amateur radio to the government. Skilled operators mean you and me, not someone else. If you want to be of service to your community by using skills acquired through amateur and public safety radio, then RACES and ARES are the means to do it.

Both organizations provide a needed service to its users, but both suffer the same problems -- resources and training. If you are not trained in a particular discipline, be it Sheriff's Department radio procedures or Red Cross terminology, then you are part of the problem, not part of the solution. [If] you and/or your organization are seen as part of the problem then you and your organization will never serve the public. Those agencies who constantly serve the public will find another medium to call upon when needed. If you say, 'there is no competition for amateur radio,' then you lack vision and fail to see the total global environment.[2]

On this recent disaster [Northridge 17-JAN-95], a cellular vendor donated the use of around 3,800 cellphones to a variety of organizations who used to depend on Amateur Radio for auxiliary back-up. Yes, I know all about the vulnerabilities of cellular, but, with this one example (believe me, there are more) the point is, the 'big one' hasn't hit. Unless we prove

our worth now -- and train and be trained by the agency we serve now -- when the 'big one' does hit (natural or man made disaster) we won't be able to provide that trained Amateur link.

We need to be activated every time an emergency arises, no matter how small or trivial. For us in the RACES, this means mutual-aid call outs and net activation for every major emergency. By doing this, we become practiced as well as trained. We become seen and recognized by all as equal partners in public safety.

Bulletin 384/385 - for Release 6/26/95

ACS Addresses: 2800 Meadowview Rd., Sacramento, CA. 95832.
Ph: 916-262-1600. FAX 916-262-1677. Landline BBS: 916-262-1657.
W6SIG@WA6NWE.CA or Internet crm@oes.ca.gov or seh@oes.ca.gov.

Footnotes:

[1] "It's time for the Amateurs to stop playing" was heard recently from a County EMS official who said (of their ACS program which includes REACT personnel), "The REACT responders are far more professional and disciplined than are the Amateurs, who waste time and energy on unrelated matters or talk." (Comment: Ouch - that hurts. Sounds like too much shop talk, reminiscing, flying decades old missions, and using "ham-speak"!)

[2] In the year following the earthquake they [REACT] succeeded in materially increasing their 'presence' in San Diego County.[See Bulletins 376 and 377]. This unit uses uniforms to augment appearance and visibility: white round-neck T-Shirt under white shirts with epaulets (short or long sleeve), green pants, black socks, black shoes, black basket weave belt with standard buckle. They have a highly involved unit today.
